Prognosis of respiratory tract infections in primary care

In the third paragraph of this Editorial (*BMJ* 2013;347:f7185, doi:10.1136/bmj.f7185), the years listed between which “the incidence of patients attending primary care for respiratory tract infections in the UK fell by 38% during summer and by 48%

during winter” were wrong. These changes were observed between 1994 and 2000, not “1997 and 2009” as was published.
