Are expanding disease definitions unnecessarily labelling women with polycystic ovary syndrome?

The meaning of the conclusion in the summary box of this article (*BMJ* 2017;358:j3694, doi:10.1136/bmj.j3694) was changed during editing. It should read "A PCOS label might not be needed to effectively treat many symptoms of PCOS, as the label may not change the type or intensity of the intervention."

We recommend carefully weighing up the benefits and harms for each individual woman. For those at risk of overdiagnosis, taking a slower, stepped approach to diagnosis might optimise benefits and reduce harm from disease labelling."
