PICTURE OF THE WEEK

A man clears debris from inside what was described as a medical supply store in Tripoli, Libya, after months of fighting between the forces of Muammar Gaddafi, Libyan rebels, and NATO. A report from Physicians for Human Rights concludes that Gaddafi's regime attacked hospitals, ambulances, patients, and doctors in Libya over the past six months.

See **NEWS**, p 439

bmj.com Read Saleyha Ahsan's blog on working in a refugee camp in Libya (<http://bit.ly/rj1W9c>)

THE WEEK IN NUMBERS

8.5 million Number of deaths that could be averted in 23 high burden countries over 10 years if population-wide salt consumption is reduced by 15% (Analysis, p 455)

86/100 Parents who said that a language promotion programme for toddlers with low spoken vocabulary benefited how they communicated with their child; however, the children's language scores at 2 and 3 years did not differ from a control group (Research, p 460)

25% Proportion of adults in the United Kingdom affected by hypertension (Practice, p 474)

QUOTE OF THE WEEK

“The media have a role in rooting out poor care, and of course scandal sells. But in addition to reporting poor standards, the media and high profile individuals should celebrate the many unsung examples of extraordinary long term care”

Graham Mulley, emeritus professor of elderly care, University of Leeds, on how the media misrepresent elderly social care in the UK (Personal View, p 481)

QUESTION OF THE WEEK

Last week we asked, “Is WHO irrelevant?”

67% voted no (total 520 votes cast)

This week's poll asks, “Should families of drug users be provided with naloxone?”

See **NEWS**, p 440

EDITOR'S CHOICE

Challenges of daily living

Assessment should be as much about establishing what doesn't need attention as what does.

How many of us went on holiday this summer thinking "Will my mother or father be OK while I'm away?" We know from experience with ageing relatives that it's well worth taking time to be prepared for crises and, when possible, to nip problems in the bud. But can doctors find enough time and commitment to do this with their older patients?

Over the next month we will be publishing four Clinical Reviews, along with related podcasts and videos, on assessing older people. In the first review Terry Quinn and colleagues argue that all doctors working with adults should be able to spot and respond to the functional difficulties that hasten older people's decline from illness and disability (p 469). Reviewing evidence mostly about people aged 80 and over, the authors explain how to assess patients' functional ability opportunistically during medical consultations. Fully evaluating someone's activities of daily living is best done at home and takes a lot longer, as a related video on bmj.com and the *BMJ* iPad app shows (www.bmj.com/site/video/functionalassessment.xhtml), but it may be a good investment of time for both patient and doctor.

Whether it will be feasible for most non-geriatricians to follow Quinn and colleagues' recommendations on functional assessment is moot, but their advice is certainly practical and down to earth. It includes asking the patient and carers about their expectations of tests and treatments, making the distinction between "what the patient wants to do, what they can do, and what they actually do," and focusing on the patient's priorities "for example, food preparation and outside mobility are important only if the patient still needs or wishes to engage in these tasks." Assessment should be as much about

establishing what doesn't need attention as what does.

Ray Moynihan tells the story of an 88 year old American woman, Fervid Trimble, for whom polypharmacy led to rapid physical and cognitive deterioration (p 446). Once her family realised what had happened, they asked her doctors not to put her on any new medicines without their permission, and Fervid's daughter Johanna became a patients' advocate, promoting the idea of drug holidays in an evidence based presentation called "Is your mom on drugs?" One key study on such "de-prescribing" was conducted by general practitioner Dee Mangin, and Moynihan clearly supports her assertion that "improving the art of 'not doing' is what will determine quality care [for older people] in the next few decades."

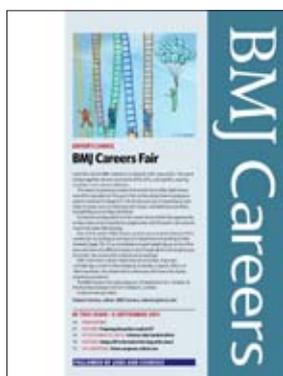

Graham Mulley acknowledges that care for older people isn't always good enough, but he is fed up with the relentless bashing it receives at the hands of the media (p 481). When invited to be a consultant adviser for a BBC expose of nursing homes, he declined to help and asked "why they did not consider making a truly original programme, which celebrated all the excellent work that is taking place in many care homes. There was a long silence." He ends with a challenge "Perhaps all of us who witness such excellence—relatives, professionals, and other visitors—should write or tweet positive messages to balance the prevailing nihilism." Please do.
