Medicine and Books

Biopsies and brushings

Monographs in Clinical Cytology. Vol 10. "Gastro-Esophageal Cytology." M Drake. Series editor G L Wied. (Pp 280; figs, 2 colour plates; \$73.75.) Karger. Distributed by John Wiley and Sons. 1985.

The flowering of gastroenterology, with its attendant rapid increase in the number of fibreoptic endoscopies of the digestive tract, has generated a lot more work for pathology laboratories. Biopsies, brushings, and aspirates are obtained with increasing frequency and are often examined by morbid anatomists without full formal training in cytology. This book is really addressed to this readership and is probably best regarded as a bench manual rather than a volume to sit on the shelves of libraries or clinicians.

This is a descriptive text based largely on the work of the cytology service in Melbourne, with little clinical validation of results. Half or more of the illustrations do not relate to cytology but are of histology, equipment, and radiographs. The techniques of collecting material for cytology are described. There is excessive emphasis on lavage rather than direct brushing or aspiration. Though clearly oesophageal cytology has little to offer in benign diseases, it is valuable to learn that negative oesophageal cytology reliably excludes cancer. With gastric cytology it is quite the reverse, and although positive results from histology and cytology are reliable, it is confirmed that negative cytology in no way excludes a diagnosis of cancer. There is some discussion about the usefulness of adjuvant gastric cytology with gastric biopsy specimens, but the conclusions are diffuse. There is no unequivocal feature on cytology to diagnose early gastric cancer as against other types of gastric cancer, but the author clearly thinks that there may be some progress in this direction.

The major weakness of this book is that the usefulness of cytology in managing patients cannot be assessed, and it is a technical guide rather than a didactic one. Pathology laboratories working in this discipline would be advised to purchase a copy despite the price.

M C BATESON

Sharp end of obstetric progress

Contemporary Obstetrics. Ed G Chamberlain. (Pp 307; figs; £18·50 paperback.) Butterworth. 1984.

If opportunistic (a word that does not appear in my copy of the Oxford English Dictionary) describes the exploiting of a good chance when it comes along then it is an appropriate word to describe this book. Over several years the British Journal of Hospital Medicine has published review articles on obstetric topics, written by acknowledged experts, who strive to give a balanced view. In Contemporary Obstetrics Geoffrey Chamberlain has brought together 30 of the best obstetric articles which were published between 1977 and 1983 in that worthy journal. To justify the title, some of the articles have been brought up to date with new material and new references. The chapters have been grouped around several common themes, all of which are relevant to current obstetric practice.

The application of ultrasound to obstetrics was pioneered by Professor Ian Donald at the Queen Mother's Hospital in Glasgow, and appropriately the first chapter, written by the team now

working at that hospital, describes the present state of ultrasound in obstetrics. Many of the advances in obstetrics, which are described in later chapters, were possible only because of this method of investigation. At a time when ultrasound in obstetrics is under close scrutiny because of the hazard to the fetus (a risk that is unsubstantiated) it is important to remember its practical benefits. An excellent example is its importance in the antenatal diagnosis of fetal abnormality, which attracts the attention of several authors. Fetal abnormality, dealt with by obstetricians, paediatricians, and geneticists, is one of the book's strongest themes. The chapter from Professor Wald and Dr Cuckle, which deals with the use of α fetoprotein in the antenatal diagnosis of open neural tube defects, is particularly informative and well written.

Other general themes include prescribing in pregnancy, recent advances in the understanding of hypertension in pregnancy, controversies in labour ward management, and the hazards facing the low birthweight baby. Social problems in obstetrics are not neglected, with chapters on the difficulties posed by pregnancies in schoolgirls and the effects of alcohol on the fetus. There is even a glimpse into the future, with one chapter devoted to the potential use of computers in antenatal care.

Those who have been regular readers of the British Journal of Hospital Medicine will inevitably experience a feeling of déjà vu when reading this book. Nevertheless, there is a great deal of excellent reading on important topics that are still at the sharp end of obstetric progress. Because most of the chapters have been written by clinicians the emphasis is on the practical aspects of obstetric care. The book may be warmly recommended to all those who are preparing for a higher examination in obstetrics and to those who seek a quick way of bringing their obstetric knowledge up to date.

P W Howie

Problems of technology

The Machine at the Bedside. Strategies for Using Technology in Patient Care. Ed S J Reiser, M Anbar. (Pp 381; figs; £30 hardback, £9.95 paperback.) Cambridge University Press. 1984.

The Machine at the Bedside is innovative in its approach and is worth reading for the thought provoking cases it describes. It is especially relevant to anyone who is responsible for putting across to students and health professionals the importance of the issues raised by medical technology and procedures. It has two parts. In the first a series of essays by various authors covers issues about the innovation, diffusion, and use of medical technology. These are competent and well written, though the selection seems a bit haphazard—why, for example, is there one chapter on intensive care and another on emergency departments, when all the rest of the chapters, though often using detailed examples, look at medical technology from a range of disciplines and some theoretical standpoints? Sometimes the content is unbalanced, too—for example, the chapter "Does technology work" looks only at diagnostic tests and clinical decision making and not at the full range of issues about the clinical evaluation of technologies and procedures. In general there is an overemphasis on decision trees, clinical algorithms, and so on, at the expense of more thorough discussion of the other topics in which medical technology is applied. Most of the chapters are interesting

and informative, however, and one of the best is Stanley Reiser's description of the changing views about medical practice, summarising medical history succinctly—and with a nice turn of phrase.

The second part of the book was of much more interest to me since it takes a more imaginative approach to the topic. Through 23 case studies it seeks to illustrate the dilemmas—clinical, ethical, and economic—that may arise in health care from the use of medical technologies and procedures. Sometimes the cases are patient histories—for example, the patient who insisted on intubation and mechanical ventilation even though it could "serve no medical purpose." Sometimes the cases are concerned with issues of organisation and management—for example, allocating a fixed budget for new equipment in a radiology department. Because the cases are American the detail is sometimes unfamiliar. The idea of a consultant in the United Kingdom taking a vote of the staff of the intensive care unit to decide whether to treat a patient seems unlikely. Nevertheless, the issues are international, and similar dilemmas in the United Kingdom may easily be recognised.

The problem with these case studies, however, is that though they provide useful teaching materials it is not clear at which students they are aimed. Some might be used with any group of health professionals or anyone who is interested in the use of medical technology. Others, such as the one on laboratory tests, require considerable medical knowledge. A more important problem with the cases is that they do not go far enough. The circumstance is described and then questions, some philosophical, are posed. It would require skilled and knowledgeable teachers to lead students through these questions. Unfortunately, it is too easy to see the problems and difficulties in this subject, and the authors might have done us more of a service if they had been asked to go further and provide structured approaches to these questions and the principles on which answers might be based, accepting of course that there can be no "right" answers.

BARBARA STOCKING

Hearing disorders

Otoneurology. Ed W J Oosterveld. (Pp 274; figs; £27.) John Wiley and Sons. 1984.

Roughly half the patients who pass through a neuro-otology clinic emerge without a firm diagnosis, and an appreciable number of cases of deafness must be considered idiopathic. We clearly need a greater understanding of the physiology and pathology of the auditory and vesibular systems, and a book that sets out to summarise our present knowledge of these is to be welcomed. Professor Oosterveld has aimed in particular at promoting the use of non-invasive methods of examination, emphasising the interpretation of physiological and pathological eye movements. The book will be of most value to the practising otologist and neurologist.

There are two substantial chapters on the physiology of hearing (Tonndorf) and balance (Parker). Dr Parker's account of the vestibular system is particularly well written and informative. Four further chapters deal with the evaluation of vestibular lesions, including accounts of electronystagmography with computer assisted interpretation of results (Black and Wall), caloric testing, the study of optokinetic nystagmus, positional testing, saccade tests, smooth pursuit and eye tracking tests, and rotatory tests (Cohen, Pyykko, and Schalen and Honrubia and Luxon). The account by Pyykko and Schalen of the differentiation of central disorders of balance from peripheral lesions is particularly valuable.

Dr Norre describes his experiences in treating vertiginous patients by a method based on the underlying principles of Cawthorne-Cooksey head exercises. It is not entirely clear what the precise scope of the system is, but it has limitations even in the author's estimation. As he says: "Sometimes it is difficult to motivate the patient to do exercises which make him sick." The relation between pathology in the neck and vertigo is discussed briefly by Cohen and more extensively by Oosterveld in the final chapter. Cohen thinks that there is no evidence for cervical vertigo,

while Oosterveld believes that the "cervical syndrome" is a real entity.

Professor Hinchcliffe discusses disorders of hearing and their assessment. Special emphasis is given to the advantages and disadvantages of different methods of testing. A section is also devoted to disorders of auditory communication in children. A comprehensive account of the role of drugs in the aetiology of deafness is given by Mr Ballantyne.

Some chapters are more clearly written than others, and authors assume different levels of pre-existing knowledge in the reader. The order of chapters appears illogical, with the chapters on physiology placed in the middle of the book and those on vestibular and auditory disorders intermingled. Each chapter, however, includes an extensive list of references, which will facilitate further study. Tinnitus might have been included, though, admittedly, there have been few recent advances in this subject. Overall the book has achieved its aims and is a useful addition on this subject.

ROBERT MILLS

Diagnosing the devastating

Dementia: a Clinical Approach. J M S Pearce. (Pp 186; figs; £15.) Blackwell Scientific Publications. 1984.

In 173 pages Dr John Pearce, a consultant neurologist in Hull, presents for the postgraduate doctor a view of dementia; 11 chapters deal with the advances in knowledge since Dr Pearce's last book on this subject, written with Dr Miller in 1973. Dr E Miller, the district psychologist at Cambridge, contributes two chapters on the epidemiological and psychological aspects, and the husband and wife team of the Perrys from Newcastle provide one each on neuropathology and neurochemistry.

In reading the chapters as a book rather than as separate review articles there is some repetition—for example, an excellent chapter on clinical testing by Dr Pearce recommends different tests to those outlined by the psychologist. My enthusiasm waned a little when I read on page 72 "... until it is shown that the elderly have a much smaller incidence of reversible pathology, we are *forced* [my italics] into investigating them." Is such negativism justified? How I wish that computed tomographic scans, which are minimally invasive and maximally informative, were readily available (p 87) in centres to which the aged patient with dementia is referred. If even only one in 100 aged people have reversible dementia should their age be a bar to proper investigation? If age is seen to be a bar will nobody bother to look?

Despite these criticisms this book is worth £15. I hope that it is read by its target audience, and in a further 10 years I look forward to the third book, which I hope will present a coherent plan for the investigation, diagnosis, treatment, and management—at all ages—of this devastating condition.
