Testing times for HIV

This Editorial (*BMJ* 2013;347:f5556, doi:10.1136/bmj.f5556) incorrectly states that a linked Research paper by Read and colleagues investigated “whether the provision of home HIV testing to men who have sex with men attending a health service would increase their frequency of HIV testing over time.” In

fact, in Read and colleagues’ study all HIV tests were performed in a public health clinic. The trial did not evaluate home testing.
