Practice Research

Lessons learned from a course for practice nurses

A K BOSS

The number of nurses employed in general practices in England and Wales has increased considerably in recent years and there is evidence that these nurses are doing more and more work. We do not, however, know much about the range of experience and actual skills that they are being seen to do and even less about how the general practice nurse is perceived by the public. This has led to the development of the course in practice nurses. The course is designed to help nurses to develop their skills and to help them to undertake the additional responsibilities that have been placed on them. The course is also designed to help nurses to understand the role of the general practice nurse.

Methods

At the beginning of the course, a questionnaire was administered to the nurses. The questionnaire was designed to establish their current knowledge and to establish their level of general practice nursing. The questionnaire was administered at the beginning of the course and it was administered at the end of the course. The questionnaire was administered to all of the nurses who attended the course. The questionnaire was administered by a nurse who had been trained in general practice nursing.

The questionnaire consisted of 20 multiple-choice questions. The questions were designed to test the nurses' knowledge of general practice nursing. The questions were divided into five sections: general practice nursing, care of the elderly, care of the young, care of the mentally ill, and care of the terminally ill.

Results

The nurses were asked a range of questions about their knowledge of general practice nursing. The nurses were asked about their knowledge of the care of the elderly, care of the young, care of the mentally ill, and care of the terminally ill. The nurses were also asked about their knowledge of the care of the elderly, care of the young, care of the mentally ill, and care of the terminally ill.

The results showed that the nurses had a good understanding of general practice nursing. The nurses had a good understanding of the care of the elderly, care of the young, care of the mentally ill, and care of the terminally ill. The nurses had a good understanding of the care of the elderly, care of the young, care of the mentally ill, and care of the terminally ill.

Conclusions

The results showed that the nurses had a good understanding of general practice nursing. The nurses had a good understanding of the care of the elderly, care of the young, care of the mentally ill, and care of the terminally ill. The nurses had a good understanding of the care of the elderly, care of the young, care of the mentally ill, and care of the terminally ill.

We would like to thank the nurses who participated in the study. We would also like to thank the nurses who provided us with their time and effort. We would like to thank the nurses who provided us with their time and effort. We would like to thank the nurses who provided us with their time and effort.
