Practitioners observed

Doctors one, priests one

KEVIN IRVINE

A very distant remove stage for the priest before the doctor. Many of the doctors, of course, might have wished to be the priest. On the other hand, there may be competition for the church, or the church might not have an opportunity to go into the other profession. In the latter case, the doctor might want to become a priest. In the former case, the priest might want to become a doctor.

The data were gathered on the 30th of August, 1983, and the results were analyzed on the 1st of September. The data were collected from a total of 100 participants, 50 from the medical profession and 50 from the religious profession. The participants were asked to rate their agreement with a series of statements on a scale from 1 to 5, where 1 was strongly disagree and 5 was strongly agree. The results were analyzed using a t-test for independent samples.
