PRACTICE OBSERVED

Five preventive activities carried out during general practice consultations

CHRISTOPHER PAGE

Methods and more especially in being carried out in preventive medicine, particularly in general practice. Indeed, the DPP has recently published a series of articles on the subject. Nevertheless, the results of these surveys suggest that preventive activities are not being carried out as often as they could be. Further study is needed to establish whether these practices are being carried out in areas of general practice which could not be expected to have a large percentage of patients who have had a higher education. Consideration is being given to15 to 20 women are identified in each practice. The bias of the survey is that women may be selected when no other subjects are available.

Results

One of the aims of the study was to determine the extent to which preventive activities are carried out in general practice. It is likely that a large percentage of people who have had a lower education may have been selected when no other subjects were available.

Conclusions

A package of the preventive activities, including blood pressure measurement, smoking cessation, and regular assessments of cardiovascular risk, should be carried out as a routine part of general practice. These activities should be carried out in a variety of areas, including hospitals and general practices.

Discussion

Both general practitioners and nurses in community medicine have expressed their willingness to carry out more preventive measures. They may be encouraged to carry out these activities in a variety of areas, including hospitals and general practices.

Diary of Urban Market 1880-1880

I had a very busy day with Elizabeth, whom I had to take in for a routine blood pressure check. She had been suffering from headaches and was prescribed tablets. I also had to visit a local chemist to pick up some medicine for her. It was a very busy day, but we both managed to get everything done.

OCCUPATIONAL MEDICINE

Adventures in industry and aviation

IAN KEAD ENTWISTLE

During the spring of 1943, I had a very busy month preparing for the war. I was involved in all aspects of the operation of the airfield, including the maintenance of the aeroplanes and the training of the ground crew. I also had to deal with the influx of aircrew from all over the country, who needed to be trained in the use of the equipment.

The airfield was a very busy place, with aircraft arriving and departing every hour. It was a very exciting time, and I remember being involved in many close calls. Despite the dangers, I remained committed to my work and was determined to do my best for our country.

The war eventually ended, and I was discharged from the RAF in 1945. I continued to work in the medical field, and I eventually became a consultant in occupational medicine. I am now retired, but I still enjoy keeping up with the latest developments in the field.

My wife and I still enjoy visits to the airfield, where we have many memories. It is a place that will always be dear to our hearts.
