Dictionary of Epilepsy

Professor H. Gastaut, of the University of Aix-Marseilles, and a group of experts from 16 countries have produced a dictionary of the clinical terms used in this disease. Recommended terms are defined, and so far as possible all known synonyms are included though they are listed separately and cross-referenced. In many cases the reasons for recommending one particular term rather than an alternative are given. The dictionary is published by the W.H.O., and was produced in response to suggestions that international organizations should take the lead in reducing the growing confusion in medical and scientific terminology. Part I is being issued simultaneously in English, French, and Spanish, and it is hoped to have it in Russian shortly. Part II is to be a multilingual index; it is not yet available.

Dictionary of Epilepsy. Part I: Definitions. H. Gastaut, W.H.O., 1973, price £2.50.

Private Medical Care

Over two-thirds of the subscribers to provident schemes for private medical care are in group schemes, usually set up by firms for key employees. The number of persons insured again increased in 1972, reaching a total of 2,169,000. These figures are given by Lee Donaldson Associates in a report for the Department of Health and Social Security.

Corrections

Smoking Hazards to the Fetus

We regret that the letter from Dr. R. J. Hickey and others (1 September, p. 501) contained a number of printing errors. The second paragraph should have read as follows:

"At least two hypotheses may explain the smoking/birth weight statistics: (1) cigarette-smoking causes low birth weight, and (2) the smoking behaviour of women and the birth weights of their children are influenced by a common cause—the individual genotype⁶ or constitution. In a study reported by Yerushalmy⁸ the percentages of low-birth-weight infants for women smokers were 6.4 (white) and 12.3 (black) and for non-smokers 3.2 and 5.8 respectively. Thus the presumed 'harm' of low birth weight was absent for over 87% of all infants. Hypothesis 2 asserts that infants born to women before they become smokers will generally be smaller than those of non-smokers. This was confirmed ($P < 0.01$) for white and weakly confirmed ($0.05 < P < 0.1$) for black women. Further, hypothesis 2 predicts a lower incidence of low birth weight among the infants of ex-smokers, while smoking, than for those of habitual smokers. This was confirmed for both black and white women ($P < 0.02$). These findings are incompatible with hypothesis 1."
