Risk of cancer from occupational exposure to ionising radiation: retrospective cohort study of workers in France, the United Kingdom, and the United States (INWORKS)

In this Research paper's (*BMJ* 2015;351:h5359, doi:10.1136/bmj.h5359) data supplement, the accompanying legend to figure S1 has been revised to indicate that the dashed line in the graph represents the fitted model for the excess relative rate (ERR) per Gy estimated over the entire cumulative dose range.
