What you need to know

- Integrated care aims to improve coordination and continuity of care for patients across organisational boundaries.
- There are many different approaches to improving care across boundaries.
- Improving care calls for effective and accountable leadership, agreement on a shared vision of improvement, and sustained patient involvement.

Integrated care is a healthcare approach focused around the patient perspective, which aims to promote better coordination and continuity of care across organisational boundaries.² Integrated care can improve patient experience³ and reduce duplication.¹ However, structural and cultural differences between physical and mental health services and across the primary and secondary care divide can impede its delivery. Perverse financial incentives and outdated expectations of doctor and patient roles are further barriers to improving care across boundaries.² Changes in service commissioning and organisational culture may promote integrated care, but its delivery ultimately depends on the skills, behaviour, and engagement of healthcare workers.

This article will explore the rationale and evidence base for integrated care and highlight salient examples of quality improvement (QI) across organisational boundaries in the UK and beyond. We aim to provide clinicians with a practical guide to implementing locally relevant, sustainable, and patient-centred change across boundaries.

Why is it important to improve care across boundaries?

The consequences of ill health extend beyond physical symptoms. Disease can affect an individual’s mental health, independence and family life. Patients want to receive responsive and holistic care from a trusted professional, in the right place and at the right time. Siloed and fragmented health systems encourage professionals to treat clinical problems in isolation; patients’ wider health and social and spiritual needs may remain unmet. Integrated care moves beyond reductive and compartmentalised approaches towards cross-boundary, coordinated, and person-centred care.

In the UK, many primary and secondary care organisations are working at maximum capacity. Finding new ways of working that bridge traditional divides can improve patient experience without overburdening professionals. Clinicians can learn new skills from their colleagues, and, by engaging in genuine co-production, discover what really matters to patients and carers. This is especially pertinent to patients living with long term conditions, who require regular contact with healthcare services.

What is the evidence for integrated care?

Most integrated care evaluations have been performed in Western European and North American settings.³ Several thousand studies have been conducted worldwide, and the volume of literature has expanded threefold since 2007.⁴ Integrated care models have largely focused on adults with long term conditions, though specialty-specific models have been described.⁸ Interventions are often complex and multifaceted. They include the introduction of joint clinics, multidisciplinary team meetings, staff education, and new financial models. Outcomes of interest include patient and staff satisfaction, health and social care resource utilisation and cost.³⁸ High quality systematic reviews suggest that integrated care can deliver improvements in patient experience and access to healthcare.⁴⁸ Evidence for economic benefits and improvements in staff satisfaction is more equivocal.⁵
Most integrated care studies are small and descriptive and fail to account for the effects of local contextual factors on outcomes. The absence of well matched control groups in many interventional studies has frustrated efforts to ascertain precisely what caused an intervention to succeed or fail, limiting generalisability and spread of best practice. Successful implementation of change across boundaries seems to be context-dependent. Emerging evidence has identified organisational culture, motivation of front line professionals, and funding as key factors influencing the delivery of integrated care.

What are the challenges and impediments to improving quality across whole systems?

Quality improvement (QI) across boundaries may form part of a wider strategy supporting integration of care at local, regional or national levels, or stem from grassroots initiatives conducted by small clinician and patient networks. These “top-down” and “bottom-up” approaches illustrate that there is no “one size fits all” method to achieve integrated care. None the less, several factors consistently promote (box 1) and impede improvement work.

Improving quality across organisational boundaries requires dedicated leadership from clinicians, managers, commissioners, and patients and carers. NHS Improvement estimates that 5% of an organisation’s workforce must receive formal training in QI methodology to foster a culture of continuous improvement, but providing time and space for QI is challenging in the current climate.

Working across boundaries calls for cultivation of a shared vision between groups with potentially competing interests. Stakeholders must invest time and effort in building relationships, and larger organisations must convince smaller providers that integrated care will provide mutual benefits rather than one-sided financial returns. Top-down approaches may necessitate changes in commissioning practices to provide financial incentives for collaboration. Separate computer systems in primary and secondary care frustrate clinicians’ efforts to form a holistic impression of a patient’s health needs and institute optimal treatment. Robust information governance frameworks and data sharing agreements are needed to promote confidence in using electronic shared records and other tools.

The patient perspective is central to all integrated care programmes. Where possible, patients should be involved in planning, conducting, and evaluating improvement work, with sufficient support to avoid tokenistic engagement. Efforts must be made to reach vulnerable and disadvantaged patient groups to avoid the unintended consequence of building inequality into integrated care models.

**How to do it well**

Clinicians, commissioners, and policymakers working across the health system need to understand which behaviour changes promote integrated care and how best to implement them. They are currently limited by a lack of high quality evidence. Current evidence suggests that there is no universal method to improve care across boundaries. Strategic and grassroots approaches are not mutually exclusive and can be synergistic in driving change. Commissioning for improvement can remove financial barriers to collaboration, but commissioning alone may be insufficient to generate sustainable change. Patient populations exhibit different behaviours and health beliefs, so we must canvass professionals and patients to identify locally relevant and tractable change ideas. The perspectives of general practitioners (GPs)—a group with substantial social capital and a rounded understanding of patient problems—are therefore invaluable. Professionals must show leadership to build networks and give patients a voice; these skills can be honed through participation in QI forums and formal training programmes.

As those most affected by changes to health systems, patients should be placed at the centre of service redesign. Co-production allows professionals to see and learn from the patient’s perspective, but patient involvement will be meaningful and sustainable only if patients are involved from the outset, clear on their responsibilities, and receive support from senior clinicians and managers. Careful thought should be given to involving vulnerable patients or their advocates to avoid exacerbating existing health inequalities.

In our experience, building relationships, maintaining patient involvement, and developing clinical leadership are essential. Table 1 shows a worked example of a QI project across organisational boundaries.

**Building relationships**

Connecting Care for Adults (CC4A), a team of hospital specialists based at Imperial College Healthcare NHS Trust, has developed a model that up-skills GPs caring for adults with long term conditions. This grassroots initiative was embedded within an overarching programme that seeks to deliver integrated care across North West London through service commissioning. Specialists and GPs conducted joint virtual registry reviews for patients living with chronic illnesses such as heart failure. Clinicians used a digital shared care record integrating primary, secondary, and social care data from eight London boroughs to create personalised care plans. GPs felt...
more confident in supporting their patients; specialists received
detailed feedback on their correspondence with primary care;
and patients had their care optimised by a specialist physician
without attending in person. The sustained success of this approach rests on the strength of
the relationships built between GPs and specialists, rational use of
digital tools, and inter-professional feedback and education.

Box 2 contains a patient’s account of the impact of this
intervention on his experience of living with long term
conditions.

Box 2: Patient perspective on remote registry reviews for
chronic disease

I am fortunate to be under the care of a clinic which has the benefit of virtual
specialist support; many of my conditions are long term and require a high
level of monitoring and care. My team at the clinic are [now] able to coordinate
this so much better...leaving me to lead a healthier life with fewer outpatient
appointments. I much prefer this to the standard approach in either the NHS
or my private appointments, where it can take many months to find solutions
and clearly my health would be at risk of deterioration.

A particular benefit is that I get specialist opinions about my conditions and
treatment not only from the specialist consultants, whom I sometimes see
privately, but also from the clinic’s NHS consultants who see the results of my
pathology and other tests and can discuss them with my team at the clinic.
I would say that it has improved my relationship with my primary care team,
and this can only be a good thing—the patient experience is much improved.

Patient involvement

As those most affected by QI and clinical transformation
projects, patients can and should play a role in their design.
Several prominent examples of patient involvement in QI come
from the Swedish region of Jönköping, which boasts a dedicated
centre for innovation and improvement known as the Qulturum.
This provides patients and healthcare professionals with training
to enhance the patient voice and incorporate it into QI. Patients
are invited to explore their experiences with clinicians at
informal coffee mornings and contribute to simulations that
seek to redesign clinical pathways around the patient
experience.

For example, one group of patients has worked with specialist
nurses to develop a new method of dialysis that maximises
patient autonomy and increases system capacity in an area with
rising demand. Dialysis-dependent patients attending the
county’s Ryhov Hospital are trained to use and maintain dialysis
equipment independently. In the words of Goran Henriks, chief
executive of the Qulturum: “[Patients] no longer think of
themselves as sick people, but as healthy people with a need
for dialysis.”

Leadership

Several organisations now seek to provide clinicians with formal
training in leadership and improvement science, while others
promote collaboration between QI leaders to hasten the spread
of ideas and best practice.

The adoption of “Big Rooms” across the UK represents a
paradigm shift in the field of QI. These QI forums, which bring
frontline staff together in structured weekly meetings, provide
an environment in which QI can thrive. Trained “flow coaches”
work with colleagues to develop a systematic plan for
improvement of a patient pathway using QI techniques and tools
including stakeholder engagement, logic models, and process
mapping. Staff use plan-do-study-act (PDSA) cycles to evaluate
small tests of change, and clinical data are displayed in statistical
process control charts to monitor progress.

The team behind the UK’s first Big Room has now established
a national Flow Coaching Academy in Sheffield. Frontline staff
from across the UK undertake a 12 month programme that trains
them to coach Big Rooms in their workplace. Big Rooms have
already produced impressive results, such as a reduction in time
to surgery in patients with acute cholecystitis and a reduction
in sepsis related mortality among hospital inpatients. The
success of this model stems from multidisciplinary team
working, strong leadership from coaches and clinicians, and
sustained engagement of frontline staff, who can suggest and
test locally relevant change ideas.

In primary care, emerging leadership initiatives such as “Next
Generation GP” aim to provide trainees with the skills needed
to shape the system around them. Trainees participate in regular
workshops that empower them to enact change and provide a
forum to share leaders’ personal stories. This helps them to
understand the opportunities and challenges faced by leaders in
primary, secondary, and social care.

For those with more experience, the Health Foundation has established the Q
Community, which aims to connect over 3000 QI leaders across
the UK. This initiative allows clinicians to pool resources and
expertise and promotes collaboration to extend the scope and
reach of improvement work.

Conclusion

Integrated care aims to improve patient experience by providing
more holistic, coordinated, and person-centred care. Improving
quality across whole systems requires stakeholder engagement,
agreement on a shared vision, clinical leadership, and patient
involvement. Policy levers, commissioning, and organisational
culture can promote integrated care, but the different health
beliefs and behaviours of patient populations dictate that there
is no universal effective approach. Ultimately, the delivery of
integrated care depends on skilled and motivated frontline
professionals with adequate time, space, and support for
innovation and improvement.

Additional education resources

Free online platform offering self directed mini-courses on quality improvement (QI) for health and social care professionals. Registration required

Free online courses targeted at early career professionals. Completion of Launch and Foundations modules leads to an NHS Leadership Academy Award in Leadership Foundations. Registration required

Massive open online course developed by Harvard University. Free to enrol and participate; registration fee for final certificate

Independent organisation that supports development of QI. Free resources include guides to promoting involvement of patients and junior doctors in clinical audit and improvement work

Education into practice

• Does your trust or general practice offer training in quality improvement (QI) methodology to staff?
• How can you empower your patient population to become involved in QI?
• What would you like to learn from your colleagues in primary or secondary care?

How patients were involved in the creation of this article

When planning this article, we asked a parent volunteer with experience of leading community based quality improvement (QI) work in North West London for her views on this topic. She said that sustained support from clinical staff was crucial in driving patient-led improvement efforts; her involvement in QI also allowed her to see the difference she could make to her local community. A second patient provided a written account summarising the benefits she had experienced as a result of improved coordination of care for her long term condition. He also read through and commented on the final draft of this article.

Contributors: CC conceived the article and wrote the first draft. NM and YR highlighted examples of quality improvement in primary care. NM, YR, and REK critically revised the manuscript for intellectual content. All authors revised the final version of the manuscript for publication.

Competing interests: We have read and understood BMJ policy on declaration of interests and declare the following interests: NM is co-founder of Next Generation GP.

Provenance and peer review: This article is part of a series commissioned by The BMJ based on ideas generated by a joint editorial group with members from the Health Foundation and The BMJ, including a patient/carer. The BMJ retained full editorial control over external peer review, editing, and publication. Open access fees and The BMJ’s quality improvement editor post are funded by the Health Foundation.

Patient consent: Patient consent obtained.

Transparency: REK is guarantor for the manuscript and affirms that it offers an accurate and transparent account of recent examples of quality improvement initiatives across the primary and secondary care divide and that no important aspects of this field have been knowingly omitted.
