Covid-19, unemployment, and health: time for deeper solutions?

As covid-19 drives unemployment rates around the world to levels unseen in generations, once radical economic policy proposals are rapidly gaining a hearing. **Martin Hensher** examines how job guarantee or universal basic income schemes might support better health and better economics

Martin Hensher *associate professor of health systems financing and organisation*^{1,2}

Covid-19 has been a dramatic global health and economic shock. As SARS-CoV-2 spread across nations, economic activity plummeted, first as individuals changed their behaviour and then as government “lockdowns” took effect.¹ Macroeconomic forecasters foresee a major recession continuing through 2020 and into 2021.² Although the governments of many nations have taken novel steps to protect workers, unemployment has risen dramatically in many countries (box 1, fig 1); poverty and hunger are on the rise in low and middle income countries.⁵ Covid-19 has directly caused illness and death at a large scale, and further threatens health through disruption of access to health services for other conditions.

Box 1: Covid-19 and unemployment

Although unemployment soared in response to covid-19 in some nations, the policy measures undertaken by

others have prevented many workers from becoming technically unemployed. In the United Kingdom, the headline rate of unemployment for April-June 2020 was 3.9%—only slightly higher than the 3.89% rate in April-June 2019. Yet in June 2020 9.3 million people were in the coronavirus job retention scheme (“furlough”) and another 2.7 million had claimed a self-employment income support scheme grant; there had been the largest ever decrease in weekly hours worked; 650 000 fewer workers were reported on payrolls in June than in March; and the benefit claimant count had more than doubled from 1.24 million to 2.63 million people.³ The Australian Bureau of Statistics has produced an adjusted estimate of Australian unemployment that includes all those temporarily stood down or laid off, to allow a closer comparison with US and Canadian statistics (fig 1). As emergency support measures are wound back, concern is growing that the downwards trend from the April peak might not be maintained in coming months.

Fig 1 | Unemployment rates in Australia, Canada, and the United States from March to July 2020.⁴

The pandemic continues to spread, and hopes for a rapid “return to normal” look increasingly unfounded. The economic consequences of covid-19 have the potential to further damage human health if not managed effectively—even after the pandemic has faded. Even with the most rose tinted views of recovery, the effects of covid-19 on unemployment are likely to be substantial and long lived. Ambitious responses to the imminent scourge of mass

unemployment are being discussed. Two such proposals—a job guarantee and universal basic income—might protect and promote health as well as prosperity. Governments around the world should consider radical plans to safeguard their citizens’ livelihoods and wellbeing.

Unemployment and health in the time of covid-19

Decades of accumulated evidence show a strong and consistent association between unemployment and a range of adverse health outcomes, including all cause mortality, death from cardiovascular disease and suicide, and higher rates of mental distress, substance abuse, depression, and anxiety.⁶⁻⁸ Job insecurity is similarly associated with poorer self-assessed health status, mental distress, depression, and anxiety.⁹ Unemployment and economic adversity are intimately related with despair and lack of hope, which have increasingly been linked with mortality and the rise and severity of the US opioid epidemic.¹⁰⁻¹¹ Whether recessions and mass unemployment increase aggregate mortality is less clear; historical studies indicated improvements in mortality during the Great Depression in the 1930s,⁷ but more recent US research found that older workers (aged 45-66) who lose their jobs in a recession have higher mortality than those who lose their jobs in boom times.¹² Insecurity, precariousness, and austerity harmed both unemployed and employed people during the protracted economic crisis in Greece after 2008-09.¹³ Meanwhile, differing welfare state institutions and unemployment insurance arrangements directly limit or amplify health inequalities in a society.^{7 14}

These factors could adversely affect the health of growing numbers of unemployed workers after covid-19.^{15 16} Governments, business lobbyists, and civil society advocates around the world are debating how economies might best recover from the covid recession. Although governments currently acknowledge the need to spend freely during the crisis, experience suggests that pressure to pursue misguided austerity policies might grow, threatening subsequent recovery. Options on the table range from “green new deal” programmes to build a post-carbon economy and national industrial strategies to bring globalised manufacturing back onshore through to calls for reducing wages and labour protections to “free up” labour markets. Yet these are all indirect approaches to the effects of unemployment. Proposals for a job guarantee or a universal basic income seek to act more directly to support individual citizens.

The job guarantee

The idea of a right to employment can be traced back to the US New Deal in the 1930s, and to Article 23 of the 1948 United Nations Universal Declaration of Human Rights. More recently, in the contest for the Democratic Party's 2020 candidate for US president, senators Bernie Sanders, Kirsten Gillibrand, and Cory Booker all included a job guarantee in their platforms, as did Alexandria Ocasio-Cortez's green new deal resolution. More than one detailed proposal for a Federal Job Guarantee has been published in the US^{17 18} and in Australia.¹⁹ In one US proposal,¹⁸ a federally funded public service employment programme would provide a standing offer of work at a living wage (\$15 (£12; €13) an hour), along with key benefits including healthcare coverage. Employees of this programme would be deployed on a wide range of public works and community development activities, delivered through federal, state, local, and non-profit agencies. The proposal argues that this would effectively eliminate unwanted joblessness and underemployment and would rapidly force the private sector to increase wages to match this “living wage” alternative, lifting millions out of poverty and greatly improving the incomes of working poor people.¹⁸ Proponents argue that the job guarantee is the most efficient “automatic stabiliser” for the economy throughout the business cycle, able to adjust up and down to reflect the changing economic health of the private sector. In economic downturns, it would provide guaranteed employment to stop people falling into poverty and losing “employability,” while also supporting aggregate demand to lift

the economy out of recession. In boom times, workers will simply exit the programme for the private sector, as firms offer higher wages to secure the additional labour they need.

In the US, the job guarantee has been proposed as not only a key tool for recovery from covid-19,²⁰ but also a mechanism to ensure that this recovery breaks down historically entrenched racial inequalities in wealth.²¹ Similarly, an emerging job guarantee proposal for Australia could rectify decades of welfare policy failures that have disproportionately affected indigenous Australians.²² Proponents point to successful past or present international experiences with full or targeted employment guarantee programmes, including Argentina's Plan Jefes, South Africa's Expanded Public Works Programme, India's National Rural Employment Guarantee Act, Belgium's Youth Job Guarantee, the US Youth Incentive Entitlement Pilot Projects, and the UK's Future Jobs Fund.²⁰

Universal basic income

Over the past few years, there has been a global explosion of interest in the concept of universal basic income.²³⁻²⁵ Andrew Yang, another former contender for the 2020 Democrat presidential nomination, made universal basic income a central plank of his platform. Such proposals share key characteristics: they are a transfer of income (from the state to individuals) that is provided universally (to everyone, with no targeting), unconditionally (with no requirements, for example to work), and in cash (with no controls on what the money can be spent on).²⁵ Proposals also typically specify an income that is sufficiently generous that it can fully cover a basic level of living expenses.²³ Universal basic income is a direct means of reducing poverty, by ensuring that all in society receive enough to live with dignity; it could reduce income inequality; it could radically simplify current social welfare systems and remove poverty traps and disincentives to move from welfare into work; it could improve the ability of workers to refuse poorly paid, insecure, exploitative or unsafe jobs, through a reduced fear of loss of income; and it could be a buffer against technological unemployment, as automation and artificial intelligence replace human labour.^{23 25} Universality is the key difference from today's welfare systems; everyone should receive universal basic income as a right of citizenship, and its receipt by all should build the solidarity and legitimacy that will sustain this right. Universal basic income could improve health and reduce health inequities through direct action on various social determinants of health.^{26 27} This variety of aims leads to the concept being simultaneously supported by those on the left as a radical, anti-capitalist policy, often viewed as an essential component of the ecological degrowth agenda, and by libertarian, tech capitalists as an efficient solution to the risk that ever expanding digital automation will destroy more jobs than it creates, and as a vital measure to help capitalism survive mass technological unemployment in the future.²⁸

In the wake of the covid-19 economic shock, universal basic income has been discussed as a potentially powerful policy solution to unprecedented economic dislocation. It has specifically been suggested as a tool for limiting the economic, social, and psychological trauma of covid-19.²⁹ The Spanish government has just introduced a nationwide, means tested minimum income programme (not universal) as a direct response to covid related unemployment.³⁰ The US government has made unconditional, one-off economic impact payments to most (but not all) American households. Near universal and unconditional universal basic income programmes have only operated at nationwide scale in two countries, Mongolia and Iran. The Mongolian programme has since ceased, and the Iranian programme is no longer strictly universal

(the richest people are no longer eligible). Partial schemes and regional pilots, however, have been run successfully in a wide range of nations.²⁵ A recent trial that provided universal basic income to 2000 recipients in Finland found that employment outcomes, health, and wellbeing measures were better in the universal basic income group than in the comparison group,³¹ and the Scottish government has been contemplating a three year trial of universal basic income in an experimental group of recipients.³²

Potential health benefits

Given the substantial evidence linking unemployment to poor health, proponents of both job guarantee and universal basic income schemes point to their potential health benefits as major arguments in their favour (table 1).^{20 26} These measures could be expected to positively affect health through four main pathways: direct effects for individual beneficiaries; knock-on effects improving labour market conditions for all workers; the macroeconomic and distributive benefits of more widespread prosperity; and more localised community effects unlocked by these programmes.

Table 1 | Health effects of job guarantee (JG) and universal basic income (UBI) programmes

Mechanisms	JG	UBI	Potential health benefits
Direct benefits for individuals			
Decreased unemployment and underemployment	Yes	Maybe	Reduced premature mortality from suicide, substance abuse, cardiovascular disease, all cause mortality ^{6,8 12} Reduced mental distress, depression, and anxiety ^{8 9} Reduced opioid and other substance abuse ^{10 33} Better access to healthcare ³⁴ Short term disability less likely to progress to long term disability ³⁵ Improved child health and development ³⁴
Reduced incentive to claim disability benefits	Yes	Maybe	
Living wage	Yes	No	
Decreased household poverty	Yes	Yes	
Reduced job insecurity	Yes	Yes	
Reduced pressure to take “bad” jobs	Yes	Yes	
Healthcare coverage (US)	Yes	No	
Better able to balance part or full time work	Yes	Yes	
Better able to prioritise caring or non-market activities	No	Yes	
Impacts on wider labour market			
Increased wages for all low paid workers	Yes	No	As above
Reduced job insecurity	Yes	Yes	
Increased pressure for all employers to provide benefits (eg, paid sick leave, health coverage)	Yes	Maybe	
Eliminates welfare traps and disincentives to take jobs	Yes	Yes	
New entrepreneurs can create business and jobs	No	Yes	
Macroeconomic multiplier effects on aggregate demand			
Increased disposable incomes and consumption lead to decreased unemployment	Yes	Yes	As above
Community benefits			
Community development, cohesion, and renewal	Yes	Yes	Reduced opioid and other substance abuse ³³ Reduced isolation and mental distress ³⁶ Improved physical activity ³⁷
Formal support programmes for elderly, frail, vulnerable people	Yes	No	
Informal care for elderly, frail, vulnerable people	No	Yes	
Volunteering, community engagement, and spirit	No	Yes	
Local environmental improvements	Yes	Maybe	

Multiple mechanisms would work through these four pathways to deliver potential health benefits, including reduced mortality and improved physical and mental health status. Key mechanisms include reducing poverty, improving economic security, improving the quality of jobs and work, and rebuilding stronger local communities. Unsurprisingly, pathways that link unemployment with poorer health will be more reliably affected by job guarantee programmes than by universal basic income. But universal basic income offers alternative pathways for better health through informal caring and non-market activities. Both types of programme could help resolve one of the problems that the covid-19 pandemic has brought into sharp focus—that low paid, insecure, and

casualised workforces cannot afford to self-isolate or stay at home when sick or potentially infected because they lack access to paid sick leave. This problem has proved especially disastrous for those who care for elderly people.

Controversies and choices

Supporters of job guarantee or universal basic income programmes typically have different priorities and view them as two alternative options, not as complementary programmes that could co-exist. Most job guarantee proposals see it as not only a means to fight unemployment, but also an explicit instrument of macroeconomic policy³⁸; universal basic income would not function as an

“automatic stabiliser” in the same way. Critics of job guarantee and universal basic income schemes primarily question their affordability and potential macroeconomic consequences (box 2).

Box 2: Economic controversies

Implementing a job guarantee or universal basic income programme would be a major economic reform in any nation and a decisive break with the economic orthodoxy that has prevailed since the Thatcher-Reagan revolution of the 1980s. It would undoubtedly be controversial. Most obviously, some would question them on cost and affordability grounds. A job guarantee programme would incur a substantial net cost to governments—modelling of proposed programmes indicates a net cost to the federal budget equivalent to 1.5% of annual general domestic product (GDP) in the US¹⁸ and 2.6% in Australia (based on a net budgetary cost of A\$51.7bn).¹⁹ By comparison, the Australian government is spending A\$70bn, or 3.6% of its GDP, on its emergency JobKeeper employment protection programme this year—budget costs of these magnitudes are not unheard of. The gross costs of a universal basic income programme would be substantially larger: income of \$12 000 (close to the 2017 US poverty line) for every US adult would cost the federal budget about \$3tn, or nearly 14% of GDP.²³ Yet this gross cost estimate is arguably misleading,³⁹ not only because universal basic income would be partially offset by large savings from current welfare programmes, but because so many recipients would return much or all of it in the form of tax payments. One estimate of the net cost of such a programme indicates that it could be as low as 2.95% of US GDP.³⁹ These proposals emerge as a growing number of economists are saying that the governments of countries in possession of their own sovereign currency can never “run out of money” and can always purchase whatever goods and services are for sale in the currency they issue.^{38 40} They also suggest that inflation—the other risk often pointed to by critics of job guarantee or universal basic income—is currently highly unlikely, with a general fear that the covid-19 recession will prove to be deflationary rather than inflationary.

For those concerned with health, however, philosophical differences might be of more interest. Social determinants and socioeconomic inequalities are well understood to be powerful forces driving health outcomes at both individual and population levels. Universal basic income seeks to reduce poverty and inequality by putting in place an absolute floor—a minimum income provided to everyone in society. A job guarantee seeks to affect poverty by ensuring that anyone who wants to work can work, for a living wage in a decent job. But in so doing, a job guarantee also explicitly increases the relative power of workers, ensuring that a larger share of national income flows to labour, rather than to the owners of capital—potentially reducing some of the extreme inequalities in income and wealth distribution that have arisen over the past four decades. One criticism of universal basic income is that it might (whether inadvertently or by design) become a “plutocratic, philanthropic” programme²⁸—scraps from the table of the ultra wealthy, which might cement dependence and powerlessness in a future of technological unemployment. Equally, a job guarantee might be criticised as being a mid 20th century solution to a 21st century problem, which will reinforce social hierarchies by insisting on participation in paid employment as the solution to poverty.

Conclusion

The unemployment triggered by covid-19 in so many countries is a clear and present danger to individual and population health. Tinkering around the margins of current welfare systems, exhortations for yet more labour market “flexibility,” or an unwillingness to maintain public spending through a potentially long and drawn out downturn all offer a fast track to poor outcomes. The scale of the covid economic shock demands more radical action.

The substantial health harms of unemployment might be mitigated by a universal basic income programme, but if unemployment is the problem, then employment seems likely to deliver more effective mitigation along the many and complex pathways by which these harms are transmitted. If so, implementing national job guarantee programmes should be a more urgent priority for governments in the immediate aftermath of covid-19. A successful job guarantee scheme would avert the harms of unemployment, strengthen the position of ordinary working people, and deliver a more broadly distributed prosperity in the short to medium term. This would be a much better position from which to then debate and trial universal basic income, allowing it to be correctly framed as a strategic, long term solution to the changing future of work, rather than simply as a response to the current economic crisis.

Key messages

- Covid-19 has triggered economic recession and unprecedented rapid rises in unemployment in many countries
- Mass unemployment has the potential to cause grave harm to individual and population health if not effectively mitigated
- The scale of the crisis means that radical solutions might need to be considered, such as a job guarantee or universal basic income programmes
- These policies have the potential to protect human health and dignity, but would mark a significant break with economic orthodoxy

Contributors and sources: MH has worked on health financing, planning, and economics as a senior policy maker and researcher in the UK, South Africa, and Australia and as a consultant for the World Bank, World Health Organization and the European Commission. His research on the ecological and economic sustainability of healthcare systems has included examining a number of emerging heterodox economic approaches, two of which are gaining in significance: ecological economics and modern monetary theory. Members of these schools have promoted universal basic income and a job guarantee, respectively, over many years. This article builds on the existing academic literature to consider very recent policy proposals that are emerging in response to the threat of mass unemployment in the wake of covid-19.
