## Correction

In the article ‘Interpreting a lateral flow SARS-CoV-2 antigen test’ (*BMJ* 2021;373:n1411 doi:) the authors state that “Evidence shows a strong correlation between Ct values and in vitro infectiousness and some evidence for increased risk of transmission from patients with higher Ct values.” The last part of that sentence should have referred to lower values (not higher) so that the corrected sentence reads “Evidence shows a strong correlation between Ct values and in vitro infectiousness and some evidence for increased risk of transmission from patients with lower Ct values.”
