Which antihypertensive treatment is better for mild to moderate hypertension in pregnancy?

In this article by Danielle Ashworth and colleagues (*BMJ* 2022;376:e066333; doi:), the definition of mild to moderate pregnancy hypertension (given in the last paragraph of the introduction) was incorrect; it should have been defined as systolic blood pressure 140-159 mm Hg and/or diastolic blood pressure 90-109 mm Hg. The online article and PDF have been corrected.
