Version 21 / 7 / 2016

**ABSTRACT**

**Objective** To evaluate the impact of searching clinical trial registries on including the results of additional randomized controlled trials (RCTs) in systematic reviews (ie, eligible completed or terminated RCT not originally included in the systematic review).

**Design** 1) We identified systematic reviews of RCTs assessing pharmaceutical treatments published between June 2014 and January 2015. 2) For all systematic reviews that did not report a trial registry search but reported the information to perform it, we searched the World Health Organization International Trials Registry Platform (WHO ICTRP Search Portal) for completed or terminated RCTs not originally included in the systematic review. We then 3) searched the results for all completed or terminated RCTs identified and 4) performed meta-analyses when additional data were retrieved.

**Data source** MEDLINE and WHO ICTRP Search Portal

**Data extraction** For each systematic review, two researchers independently extracted the outcomes analyzed, the number of patients included and the treatment effect estimated. For each RCT identified, two researchers independently determined whether the results were available (ie, posted, published or available on the sponsor website) and extracted the data.

**Results** Among 223 selected systematic reviews, 116 (52%) did not report a search of trial registries; 21 of these did not report the information to perform the search (key words, search date). We performed the search for 95 systematic reviews; for 54/95 (57%), we found no additional RCTs and for 41/95 (43%) we identified 122 additional RCTs. The search allowed for increasing the number of patients by more than 10% in 19 systematic reviews, 20% in 10, 30% in seven, and 50% in four. Moreover, 63 RCTs had results available; the results for 45 could be included in a meta-analysis. We reanalyzed 14 systematic reviews including 45 RCTs. The weight of the additional RCTs varied from 0% to 58% and increased by 10% in five of 14 systematic reviews, 20% in three, and 50% in one. The change in summary

1  
2  
3 statistics varied from 0% to 29% and was greater than 10% for five of 14 systematic reviews  
4  
5 and greater than 20% for two.  
6

7 **Conclusions** Trial registries are an important source for identifying additional completed and  
8  
9 terminated RCTs. The additional number of RCTs and patients included if a search were  
10  
11 performed varied across systematic reviews.

## INTRODUCTION

Systematic reviews are considered to provide the highest level of evidence[1,2]. They are widely used by clinical practice guideline developers, granting health agencies and journal editors [3–6]. A major challenge of systematic reviews is to identify all relevant randomized controlled trials (RCTs), whatever their publication status[7–14]. Indeed, results for half of RCTs are never published [15] and the publication status is affected by the nature and direction of results, which may bias the results of the systematic review[16].

Initiatives aimed at reducing publication bias include the trial registration policy initiated by the International Committee of Medical Journal Editors (ICMJE) in 2005[17]. In 2007, the US Food and Drug Administration Amendments Act (FDAAA) required the posting of clinical trial results at ClinicalTrials.gov no later than one year after the date of final collection of data for the pre-specified primary outcome, for all phase II to IV trials of drugs, biologic treatments and devices having at least one site in the United States[18,19]. The research community has embraced this policy, and there was a marked increase in trial registration around the time of implementation of the ICMJE policy[20]. In April 2016, about 90,000 completed experimental studies were registered at ClinicalTrials.gov (the largest registry), and 16,500 have results posted.

When performing systematic reviews, the search of trial registries is now considered an essential tool [3,21–23]. Nevertheless, to our knowledge, the impact of searching trial registries has never been evaluated.

The objectives of this study were to 1) describe whether and how clinical trial registries were searched in published systematic reviews of pharmaceutical treatments and 2) evaluate the impact of searching trial registries on the identification of additional RCTs (ie, eligible completed or terminated RCTs not included in the systematic review). For this purpose, we identified a sample of systematic reviews of RCTs assessing pharmaceutical treatments

1  
2  
3 indexed in PubMed and recorded whether a search of clinical trial registries was performed.

4  
5 Then, for all systematic reviews not reporting a search in clinical trial registries but reporting

6  
7 the information to perform it, we systematically performed the search.

## METHODS

### Identification of systematic reviews

We systematically searched MEDLINE via PubMed for all systematic reviews of RCTs assessing pharmaceutical treatments that were published in English between June 1, 2014 and January 31, 2015 by searching for “Meta-Analysis[ptyp] AND ("2014/06/01"[PDAT]: "2015/01/31"[PDAT]) AND English[lang] appearing in the title, abstract or keywords (date search: March 16, 2015)

One researcher screened all titles and abstracts of citations retrieved to identify all reports of systematic reviews of RCTs with at least one meta-analysis including at least two RCTs and assessing pharmaceutical treatment (ie, drug, health-related biological product or biologic supplementation). We excluded updates of previously published systematic reviews and systematic reviews of diagnostic test accuracy, prognosis, economics evaluations, genetics, non-RCT studies, network meta-analyses, indirect comparison meta-analysis as well as individual patient data meta-analyses. The full-text of potentially relevant citations was obtained. As a quality control procedure, another researcher independently screened 20% of the citations and confirmed the eligibility of all systematic reviews included. Discrepancies were discussed to reach consensus.

### Data extraction

From the published reports and supplementary appendices when available, two researchers independently recorded the following:

- 1) the general characteristics of the systematic review (ie, the type of journal: general medical journal, specialty journal or Cochrane review), the funding source (public,

private or unclear), and the number of RCTs and participants included in the systematic review.

- 2) the reporting of the clinical trial registry search (ie, whether a search in a clinical trial registry was reported, the name and type of registries searched, and whether the results of the search were reported (the number and identification of RCTs identified from the clinical trial registry search).

Any disagreement was resolved by discussion and consensus.

### **Impact of searching clinical trial registries**

For each systematic review that did not report a search in clinical trial registries, we systematically performed a search reproducing the conditions of the original search reported in the systematic review, particularly taking into account the date of the search and the inclusion criteria of the systematic review.

We screened the retrieved records and identified all eligible completed or terminated RCTs that were not initially included in the systematic reviews. Then, for each RCT identified, we systematically searched for results and determined whether RCTs with results could be included in at least one meta-analysis.

### Search strategy

Our search strategy followed the same search and selection process described by the authors of the published systematic reviews.

- 1) From the selected full-text articles and all available supplementary materials, we systematically recorded the search terms related to the condition and interventions used by authors and the date of last electronic search. Systematic reviews that did not provide search terms or the date of search were excluded from this analysis.

Version 21 / 7 / 2016

1  
2  
3 2) We searched the World Health Organization International Trials Registry Platform  
4  
5 (WHO ICTRP Search Portal). We chose this portal because it includes 16 national and  
6  
7 international primary registries including ClinicalTrials.gov. In the advanced search  
8  
9 window of the WHO ICTRP Search Portal (<http://apps.who.int/trialsearch/>), we  
10  
11 entered the search terms recorded in the “condition” and “intervention” fields with  
12  
13 Boolean operators. We chose “all” in the “recruitment status” field and “Search for  
14  
15 clinical trials in children” when appropriate. Details of the search strategies and  
16  
17 keywords for each systematic review are available in Appendix 1.  
18  
19  
20  
21  
22

### 23 Identification of completed or terminated RCTs

24  
25 For each search, we downloaded all the citations retrieved and identified all studies registered  
26  
27 before the date of the last search reported in the systematic review and with a recruitment  
28  
29 status recorded as “completed” or “terminated”.  
30  
31

32 For each systematic review, two researchers independently screened the records retrieved and  
33  
34 selected all completed or terminated RCTs not already included in the systematic review that  
35  
36 fulfilled the systematic review eligibility criteria in terms of participants, interventions, and  
37  
38 comparator. We systematically verified in the history or archives of the registry that the  
39  
40 recruitment status was recorded as “completed” or “terminated” before the date of the search  
41  
42 (Appendix 2). Any disagreements were resolved by consensus. A third researcher screened all  
43  
44 selected records to confirm their inclusion.  
45  
46  
47  
48  
49

### 50 Availability of RCT results

51  
52 For each selected RCT, two researchers independently determined whether the trial results  
53  
54 were available (ie, posted, published or available on the sponsor website). We searched for 1)  
55  
56 results posted on clinical trial registries and 2) publications referenced on the trial registry and  
57  
58  
59  
60

1  
2  
3 3) performed an electronic search of PubMed and Google and searched the sponsor website.  
4  
5 All trials with results available were screened, and we selected only trials for which the results  
6  
7 became available before the last electronic search of the systematic review.  
8  
9

#### 10 11 12 Inclusion of the RCT results in meta-analyses

13  
14 For each systematic review, we determined whether the additional RCTs with results  
15  
16 available could be included in at least one meta-analysis. We recorded the number of meta-  
17  
18 analyses reported in the systematic review, the number of meta-analyses that could include  
19  
20 the additional RCTs, and the number of meta-analyses for which all the RCTs identified had  
21  
22 available results and could be included in the meta-analysis.  
23

24  
25  
26 Finally, we determined the impact of including the RCTs on treatment effect estimates. For  
27  
28 each systematic review, we identified one meta-analysis in which at least one RCT with  
29  
30 results available could be included. We considered successively the meta-analysis of 1) the  
31  
32 primary efficacy outcome, 2) the primary safety outcome, and 3) the most clinically relevant  
33  
34 outcome. If none of the above meta-analyses could include an RCT, we selected the meta-  
35  
36 analysis that could include at least one RCT that was reported first.  
37  
38

39  
40 For each meta-analysis selected, we extracted from the RCTs identified the outcome data (ie,  
41  
42 number of events and number of patients in each group, means, standard deviations, etc).  
43  
44 When the outcome data were available in several sources, we considered in priority the data  
45  
46 reported 1) in the registry, 2) in a published report and 3) on the sponsor website.  
47  
48

#### 49 50 51 52 **Data analysis**

53  
54 Statistical analyses involved use of R version 3.1.0 (<http://www.R-project.org>, the R  
55  
56 foundation for statistical Computing, Vienna, Austria). Qualitative variables are represented  
57  
58  
59  
60

Version 21 / 7 / 2016

1  
2  
3 by percentages. Quantitative variables are represented by medians (1st quartile–3rd quartile  
4 [Q1-Q3]). For the meta-analysis selected for recalculation (one per selected systematic  
5 review), we calculated summary statistics (risk ratios, odds ratios, hazard ratios, mean  
6 differences or standardized mean differences) and the  $I^2$  statistic (measure of heterogeneity)  
7 with and without trials retrieved by a trial registry search. We reported the magnitude of the  
8 change in the result of the meta-analysis as a percentage change in the summary statistic after  
9 including the RCTs retrieved. We replicated the published meta-analysis in terms of the  
10 statistical method (Peto, Mantel-Haenszel, inverse variance), strategies for assessing  
11 heterogeneity, analysis model (fixed  $\nu$  random effects), and measure of effect (risk ratio, odds  
12 ratio, weighted mean difference).

## RESULTS

### Identification and characteristics of reports

Among the 2,249 citations retrieved, we selected 223 reports of systematic reviews with meta-analyses (fig 1). The characteristics of the selected systematic reviews are in table 1. One-third (35%) were Cochrane reviews; the median [Q1-Q3] number of RCTs included in systematic reviews was 10 [6-18] and the median [Q1-Q3] number of patients was 1,594 [614-5027].

### Reporting of clinical trial registry search in systematic reviews

Among the 223 systematic review reports included, 107 (48%) reported the search of at least one clinical trial registry. Only individual registries were searched in 48 (45%) systematic reviews, only portals in 11 (10%) and a combination of individual registries and portals in 44 (41%). The portal and the individual register the most frequently searched was the WHO ICTRP Search Portal (n=53, 50%) and Clinicaltrials.gov (n=89, 83%), and for 40 studies (37%) both were searched. The results of the clinical trial registry search was clearly reported (ie, with a description of the number and the identification of RCTs identified from the search) in only 47 (21%) reports (fig 1, table 1).

### RCTs identified by searching clinical trial registries

Among the 116 systematic reviews not reporting a search in trial registries, for 21 (18%), we were not able to perform the clinical trial registry search because the search date or the keywords were not reported. Therefore, we performed the search for 95 systematic reviews. Among the 15,282 records screened (median [Q1-Q3] records screened for each systematic review = 23 [6-150]), we identified 122 eligible RCTs terminated or completed (involving 52,743 patients) not originally included in the systematic review.

Version 21 / 7 / 2016

1  
2  
3  
4  
5 Overall, the trial registry searches identified at least one eligible RCT for 41 (43%) systematic  
6 reviews, with a median [Q1-Q3] of 9% [4-18] additional patients per systematic review (fig 2,  
7 table 2). Among these 41 systematic reviews with additional RCTs identified, the number of  
8 patients included was increased by 10% in 19, 20% in 10, 30% in 7, and 50% in 4 (fig 3).  
9  
10  
11  
12  
13

14  
15  
16 We identified results for 63/122 RCTs (52%) involving 42,202 patients, and 45/122 (37%)  
17 involving 21,358 patients could be included in the quantitative analyses (ie, reported  
18 sufficient data to be included in at least one meta-analysis of the systematic review). The 18  
19 remaining RCTs with results could not contribute to the quantitative analysis because the  
20 outcome of interest was not reported. The results of the RCTs identified were 1) posted  
21 (n=41, 65%); 2) published as identified by a reference reported on the registry (n=21, 33%) or  
22 from a complementary search (n=10, 16%); or 3) were available on the company's Web site  
23 (n=31, 48%). The results were available in one (n= 29, 46%), two (n=27, 43%) or three  
24 sources (n= 7, 11%).  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37

38 For 14 systematic reviews, the trial registry searches allowed for identifying RCTs with  
39 results (n= 45) that could contribute to the quantitative analysis. Among the 73 meta-analyses  
40 reported in these 14 systematic reviews; the search in trial registries retrieved additional  
41 results that could be included in 59 meta-analyses. Overall, 31/59 meta-analyses were  
42 considered complete (ie, all the RCTs identified had available results and could be included in  
43 the meta-analysis).  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

**Impact of the search of clinical trial registries**

Finally, we recalculated the effect estimates for one meta-analysis selected from the 14 systematic reviews including RCTs that could contribute to the quantitative analysis. The weight of the eligible RCTs included ranged from 0% to 58% and was increased by 10% in five of 14 systematic reviews, 20% in three, and 50% in one. The change in summary statistics varied from 0% to 29% and was greater than 10% for five of 14 systematic reviews and greater than 20% for two (table 2).

## DISCUSSION

### Summary of findings

Despite recommendations [23], only one-fifth of the published systematic reviews performed and reported the results of a search of trial registries. Our trial registry search allowed for identifying additional studies for 43% (n=41/95) of the systematic reviews published, thus increasing the number of patients included by 10% in 18 reviews, 20% in nine, 30% in six and 50% in four. However, because of the lack of data availability, data for half of the eligible RCTs retrieved could not be included in systematic reviews. We re-analyzed 14 meta-analyses to include data from RCTs retrieved by the trial registry search. The weight of the eligible RCTs included varied from 0% to 58% and the change in summary statistics from 0% to 29%.

### Comparison with other studies

Our results are consistent with other studies showing that the search for unpublished trial data is still often lacking in systematic reviews [24–29] as in a random sample of 300 recent systematic reviews indexed in MEDLINE in February 2014 of which 19% reported searching trial registries[24]. This lack of registry searching is considered unethical by some authors [9]. A previous study by Hart in 2012 aimed to re-analyze meta-analyses by adding unpublished trial outcome data obtained from the US Food and Drug Administration (US FDA) to published meta-analyses[30]. The study documented that the addition of unpublished trial data obtained from the US FDA could change the magnitude of the effect size or in a few cases the statistical significance of meta-analyses. However, to our knowledge, the impact of searching trial registries in terms of identifying trials and their inclusion in the analysis when results are available has never been evaluated.

### Limitations

Our study has some limitations. First, we searched only the WHO ICTRP Search Portal using the keywords reported by authors for their electronic search. Consequently, we cannot claim that we identified all RCTs. However, this portal brings together 16 national and international primary registries including ClinicalTrials.gov. Furthermore, in a previous study, the overlap between ICTRP and ClinicalTrials.gov was good, because all records identified in ClinicalTrials.gov were also identified in ICTRP[31]. Second, we did not account for eligibility criteria related to trial quality, and some trials could secondarily be excluded because of insufficient quality. Third, we did not attempt to contact investigators of the unpublished trials to obtain results. In fact, we aimed to reproduce the condition the authors encountered and it would not be appropriate to ask authors for results after such a delay. Therefore, the number of systematic reviews with trials identified by clinical trial registry searching and the results of RCTs retrieved from clinical trial registries are possibly underestimated. Finally, we focused on only systematic reviews of pharmaceutical treatment and cannot extrapolate to non-pharmaceutical treatments because the regulation for trial registration and posting of results is less stringent with these treatments.

### Implications for clinicians and policy makers

Clinical trial registries have been developed and enforced by editors and policy makers to reduce waste in research and publication bias. They have been considered an important step toward more transparency and increasing research value. However, the collection of these data is relevant only if it is actually used to reduce waste in research. Actually searching clinical trial registries is still not routine: in our study, among 223 systematic reviews, 107 (47%) of the authors reported searching at least one clinical trial registry. Therefore,

Version 21 / 7 / 2016

1  
2  
3 systematic reviewers who are not using these essential databases could miss an important  
4  
5 opportunity[25,27,29].  
6

7  
8 The additional work needed to screen trials registries is small; for example, in our study, the  
9  
10 median [Q1-Q3] number of of RCTs screened for each search was 23 [6-150]. However, this  
11  
12 effort is counterbalanced by the lack of availability of results, particularly the lack of posting  
13  
14 results. Indeed, a previous study showed that the reporting of results was more complete at  
15  
16 ClinicalTrials.gov than in published reports[32]. Actually, despite many initiatives to  
17  
18 facilitate the access of clinical trial results, such as the FDAAA in 2007, which required the  
19  
20 posting of clinical trial results,[18] or pharmaceutical company policies, the posting of results  
21  
22 is limited[33,34]. In the cross sectional study authored by Prayle et al, among 738 registered  
23  
24 trials, 22% posted results according to the mandatory FDAAA 801 requirements[35]. Our  
25  
26 study showed similar results: among the 122 RCTs identified as completed or terminated in a  
27  
28 registry, only 41 (34%) had results posted.  
29  
30  
31

32  
33 For authors, editors and peer reviewers, the use of trial registries in systematic reviews needs  
34  
35 improvement. Furthermore, health authorities should pursue their policy to improve the  
36  
37 registration of trials and the posting of results. Some researchers have developed an  
38  
39 intervention to improve posting, such as emailing a reminder of the FDAAA 801 requirement  
40  
41 to responsible parties[36]; other interventions are necessary.  
42  
43  
44

## 45 **CONCLUSION**

46  
47 Searching clinical trial registries is essential for identifying additional trials that could  
48  
49 increase the value of systematic reviews. However, the lack of availability of RCT results  
50  
51 limits the value of the search. Trial registry searching should be promoted and enforced, as  
52  
53 should the posting of trial results.

**Acknowledgements**

We thank Laura Smales (BioMedEditing, Toronto, Canada) for English language proofreading. We thank Carolina Riveros for data extraction.

**Contributions**

Conceived, designed and experiments: MB, AY, IB, PR, Wrote the first draft: MB, IB, AY Contributed to the writing of the manuscript: MB, AY, IB, PR Data analyses MB, AY, and EP.

**Transparency declaration**

AY affirms that this manuscript is an honest, accurate, and transparent account of the study being reported; that no important aspects of the study have been omitted; and that any discrepancies from the study as planned have been explained.

AY and IB had access to all of the data in the study and take responsibility for the integrity of the data and the accuracy of the data analysis.

**Data sharing**

All data from this study—including literature searches, additional explanatory material, and data extraction forms—are available on request.

**Conflicts of interest**

None of the authors have conflicts of interest to declare.

**Financial support**

This study received no funding.

## APPENDIX

### Appendix 1: Verification of the recruitment status according to the registry

#### ClinicalTrials.gov

We systematically verified the Last Verified date recorded in the registry (ie, the most recent date on which all of a clinical study's information on ClinicalTrials.gov was confirmed as accurate and current).

If the Last Verified date was before the date of the search, the trial was included.

If the Last Verified date was after the date of the search, we verified in the archives of the registry Web site when the status was modified and we excluded trials that were recorded as “completed” or “terminated” after the date of search.

#### UMIN registry:

We systematically verified the “Date of last update”. If this date was before the date of the search, the trial could be included.

If the “Date of last update” was after the date of search, we verified that the “date trial data considered complete” and the “date analysis concluded” was before the date of the search and we verified in the history of the registry that these dates were recorded before the date of search; if not, the trial was excluded.

#### ISRCTN:

We systematically verified the “Last edited” date. If this date was before the date of the search, the trial could be included.

If the “Last edited” date was after the date of the search, we verified the “Recruitment end date” and the “Overall trial end date.”

Because this registry did not give access to archives, if additional identifiers with a ClinicalTrials.gov number was provided, we searched this registry.

**ANZCTR:**

We systematically verified the timing of the registration status in the history.

The history reported the timing of the modification with the reason for the modification.

**Eudract:**

We downloaded the full trial details; we checked the trials status and the date on which this record was first entered in the EudraCT database

**Appendix 2: Keywords, date of search and finding in the WHO ICTRP Search Portal**

ID	Key words used in "Conditions" field	Key words used in "Interventions" field	First limit of search	Last electronic search	Citation findings

1. **1 Systematic review ID 474**2. **1.1 Title of the systematic review**

Angiotensin converting enzyme (ACE) inhibitors versus angiotensin receptor blockers for primary hypertension

1. **1.2 Inclusion criteria**

Studies :

- — directly compared an ACE inhibitor and an ARB ;
- — randomized participants to the ACE inhibitor group or the ARB group ;
- — had the same protocol regarding continuation or discontinuation of pre-study blood pressure lowering therapy in both arms ;
- — had the same protocol for adding background blood pressure lowering therapy during the trial in both arms ;
- — had a prespecified duration of at least one year ;
- — were double blinded when included for WDAE.

2. **2.1 Title of the systematic review**

Bivalirudin versus heparin in patients planned for percutaneous coronary intervention : a meta-analysis of randomised controlled trials

1. **2.2 Inclusion criteria**

Trials were included if they enrolled individuals with planned PCI and randomly assigned patients to treatment with bivalirudin (using the approved dosing regimen) or heparin (mostly unfractionated heparin [UFH], but also low-molecularweight heparin) with or without a GPI. Trials that did not report clinical outcomes, involved fibrinolytics, were done before coronary stenting was available, or compared bivalirudin with anticoagulant regimens other than heparin or

low-molecular-weight heparin were excluded from the analysis.

Dabigatran Etexilate and Risk of Myocardial Infarction, Other Cardiovascular Events, Major Bleeding, and All-Cause Mortality : A Systematic Review and Meta-analysis of Randomized Controlled Trials

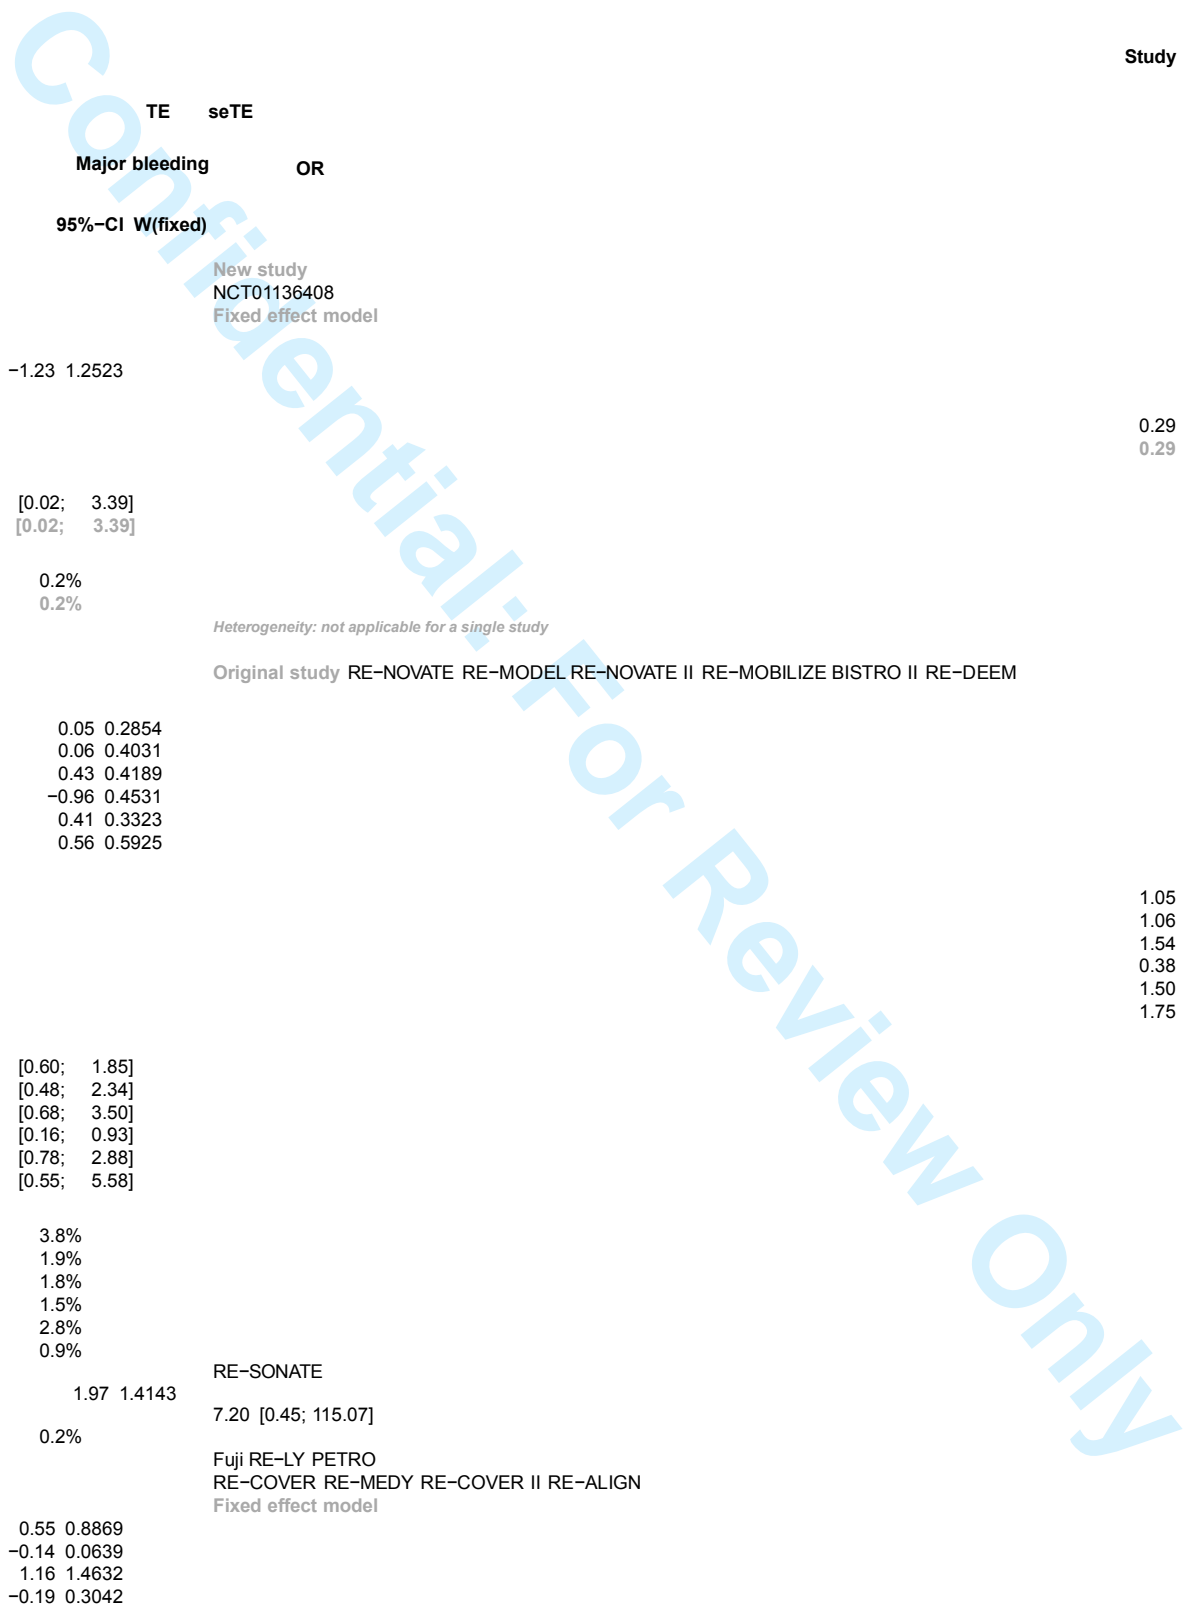

1. **6.2 Inclusion criteria**

To be included in the meta-analysis, clinical trials should present the following criteria : (1) it should be an RCT and (2) the follow-up should have been the same between the different groups. In addition, (3) the control groups should receive a placebo or the reference treatment when applicable. This meant (3a) warfarin was the reference treatment in patients with NVAF and in the treatment of venous thromboembolism (VTE) or pulmonary embolism ; (3b) enoxaparin was the reference treatment for the prevention of VTE events in patients undergoing total hip or knee surgery ; and (3c) placebo was used for the prevention of recurrence of coronary events in patients receiving antiplatelet therapy or for the prevention of recurrence of VTE events in patients who had completed a first period of anticoagulant therapy.

Biologic Therapies in Rheumatoid Arthritis and the Risk of Opportunistic Infections : A Meta-analysis

1. **9.2 Inclusion criteria**

A randomized trial of a biologic agent was considered eligible if it fulfilled all of the following conditions :

- — randomized patients with RA,
- — randomized Food and Drug Administration ?approved biologic agents for treatment of RA,
- — compare the effect of a biologic agent with that of a control drug, and,
- — provided safety data to calculate ?1 outcome of interest.

The control arm included either placebo or disease-modifying antirheumatic drugs/conventional therapy. Low-dose corticosteroids (<10 mg equivalent to prednisolone) were permitted in all arms.

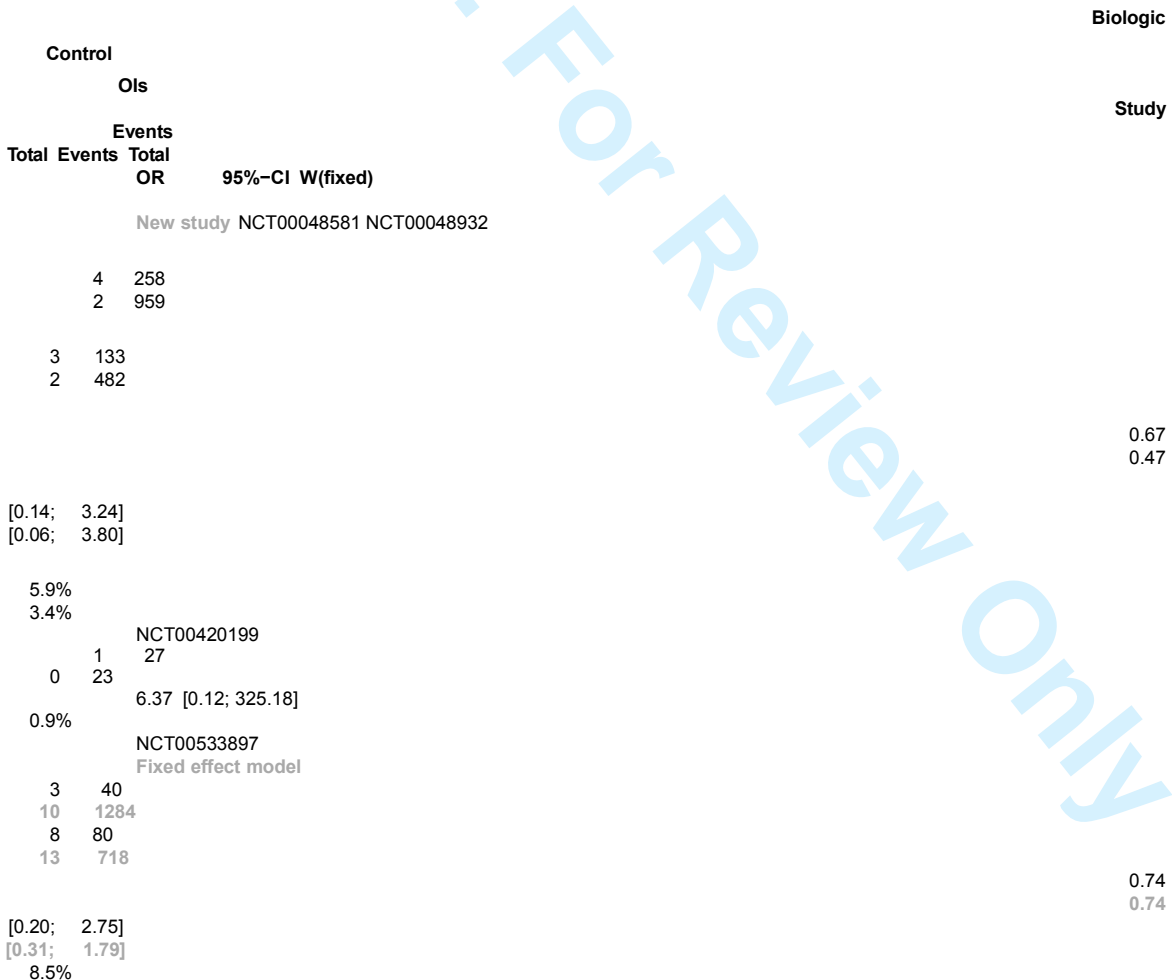

A study was considered ineligible if it included

- — no data on OIs;
- — compared different dosing, schemes, or routes of the same biologic agent;
- — randomized 2 biologic agents;
- — or included agents not approved for RA.

1. **10 Systematic review ID1580**

2. **10.1 Title of the systematic review**

Safety and efficacy of addition of VEGFR and EGFR-family oral small-molecule tyrosine kinase inhibitors to cytotoxic chemotherapy in solid cancers : A systematic review and meta-analysis of randomized controlled trials

1. **10.2 Inclusion criteria**

Clinical trials that met the following criteria were included :

- — phase II and III trials in patients with solid cancers ;
- — random assignment of participants to treatment with chemotherapy plus VEGFR or EGFR-targeted TKI or chemotherapy alone ;
- — reporting data for at least one of the safety or efficacy outcomes.

Pharmacological treatment of neuropsychiatric symptoms in Alzheimer’s disease : a systematic review and meta-analysis

1. **11.2 Inclusion criteria**

Trials were selected for inclusion if they met all of the following criteria :

- — double-blind, placebo controlled, randomised controlled trials (RCTs);
- — the design of the trial was either parallel or crossover ; for a crossover trial, it had a washout period greater than 1 week;
- — patients enrolled were diagnosed as probable or possible AD according to the Diagnostic and Statistical Manual of Mental Disorders ?Fourth Edition or the criteria of the National Institute of Neurological and Communicative Disorders and Stroke/Alzheimer ?s Disease and Related Disorders Association;
- — studies compared any medicine at any dose with placebo, with any treatment durations;
- — neuropsychiatric outcomes were measured with the most common neuropsychiatric scales Neuropsychiatric Inventory (NPI) (NPI-10 or NPI-12) or Neuropsychiatric Inventory-Nursing Home version (NPI-NH).

1. **12 Systematic review ID2086**

2. **12.1 Title of the systematic review**

The long-term efficacy and safety of DPP-IV inhibitors monotherapy and in combination with metformin in 18 980 patients with type-2 diabetes mellitus a meta-analysis

1. **12.2 Inclusion criteria**

Studies were deemed eligible for inclusion in pooled analysis if they met the following criteria :

- — were phase 3 or later, prospected and randomized controlled trials of ≥ 24 weeks’ duration,
- — enrolled adult patients with T2DM,
- — were comparing DPP-IV inhibitors with placebo, DPP-IV inhibitors +metformin with metformin and DPP-IV inhibitors + metformin with sulphonylureas + metformin and
- — have at least 50 subjects in every arm of the studies.

2. **13.1 Title of the systematic review**

Systematic review and meta-analysis of ustekinumab for moderate to severe psoriasis

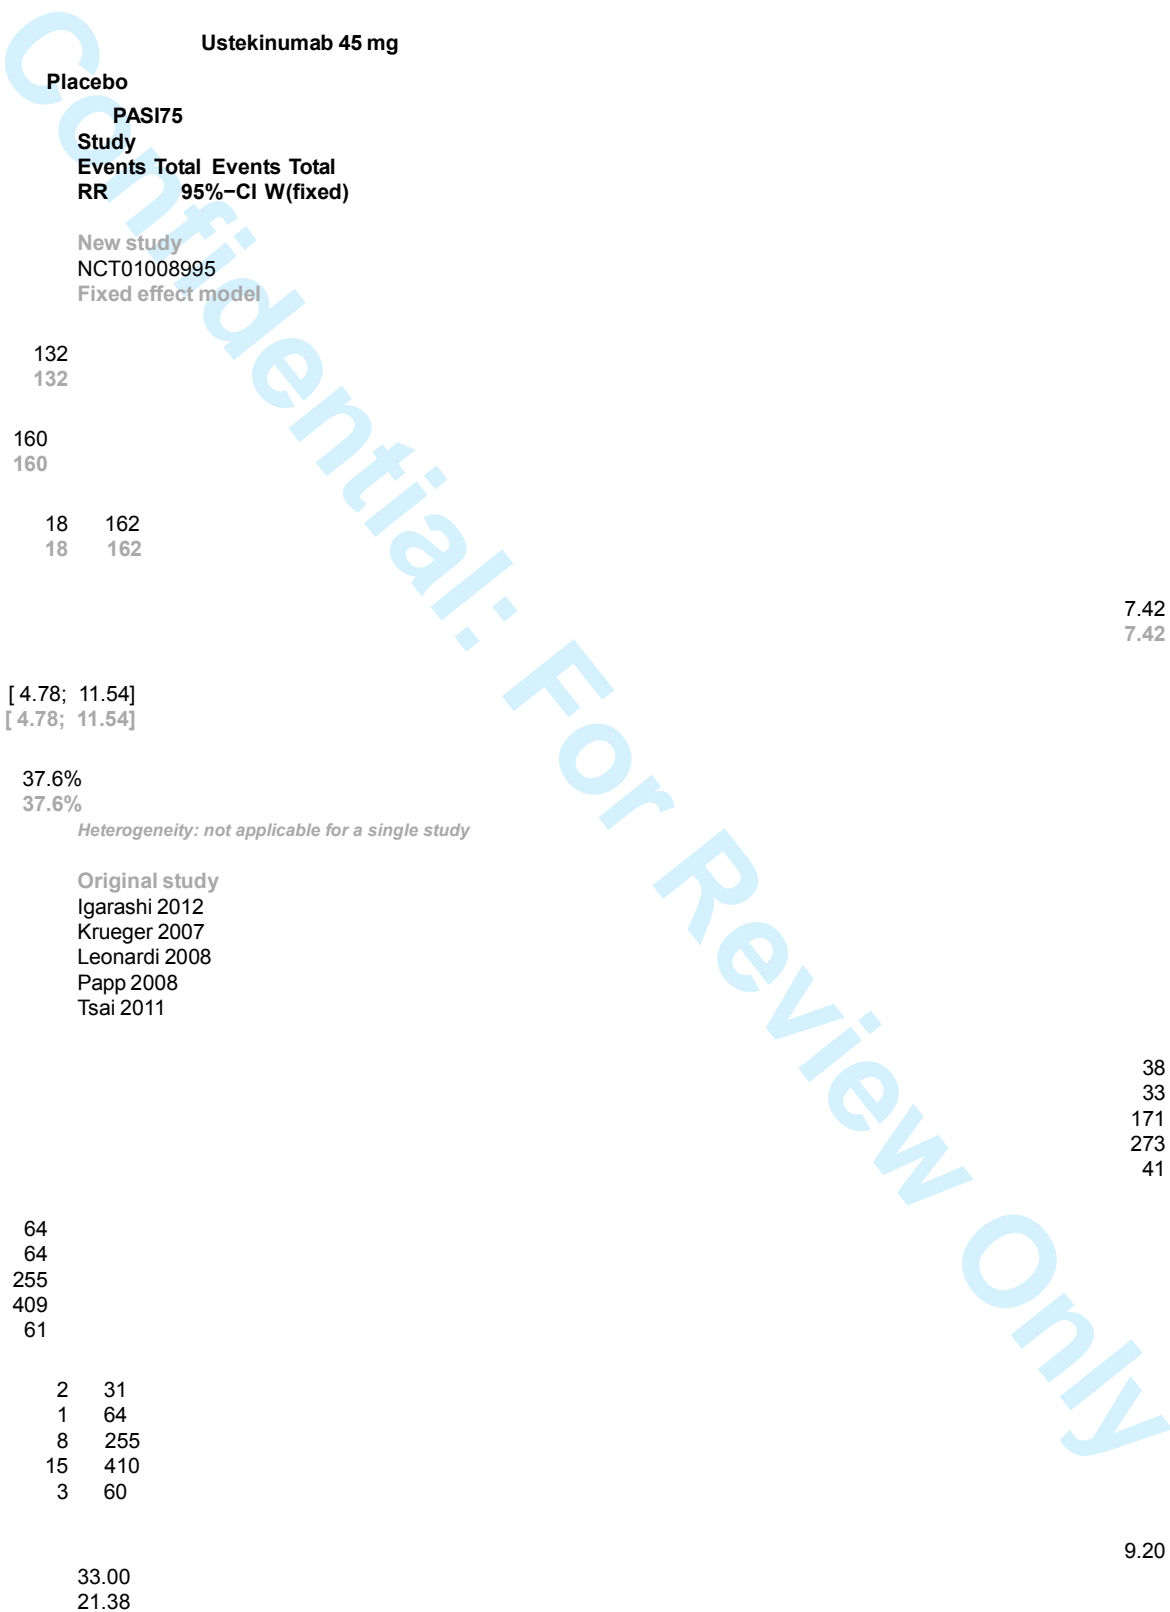

1. **13.2 Inclusion criteria**

Firstly, the RCTs had to include patients with a proven diagnosis of plaque psoriasis for at least 6 months. Exclusion criteria for patients included known malignancy (except treated basal cell skin cancer or squamous cell skin cancer of at least 5 years duration) or recent serious systemic or local infection. Exclusion criteria for controls included systemic use of corticosteroids, immunosuppressants or agents specifically targeting IL-12 or IL-23 with a withdrawal time of < 2 weeks. Thirdly, articles lacking original data for meta-analysis and review articles were excluded.

1. **14 Systematic review ID2193**

2. **14.1 Title of the systematic review**

Efficacy and toxicity of adding cetuximab to chemotherapy in the treatment of metastatic colorectal cancer : a meta-analysis from 12 randomized controlled trials

1. **14.2 Inclusion criteria**

Studies that met the following criteria were considered for inclusion :

- — randomized controlled trials;
- — the study population of patients aged  $\geq 18$  years ;
- — eligible patients with histologically or cytologically confirmed mCRC;
- — randomized allocation to cetuximab plus chemotherapy group or chemotherapy group ;
- — results reported data on efficacy and safety.

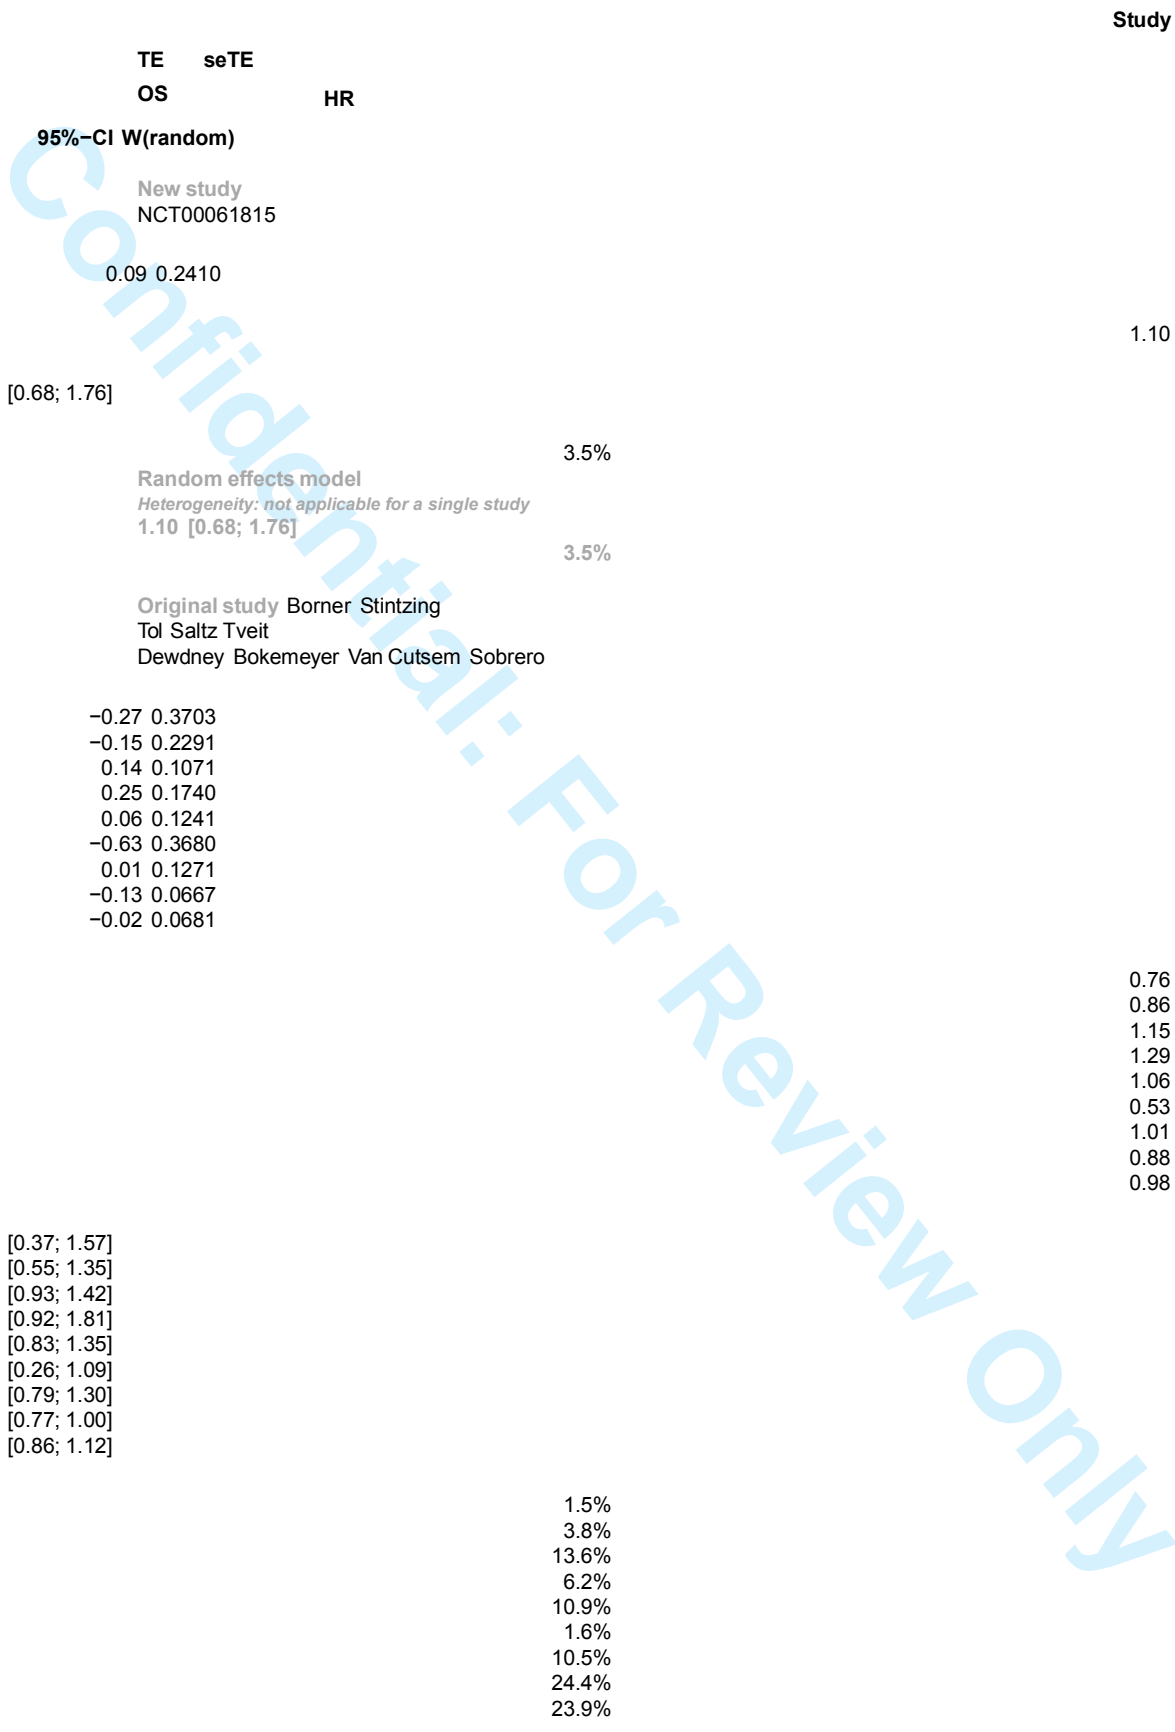

Reports were excluded from the final analysis if they described studies with a single-arm design or randomized controlled trials that assigned cetuximab into the two treatment arms.

## BMJ

### **Licence to BMJ Publishing Group Limited (“BMJ Group”) for Publication**

To be agreed to by the corresponding author or guarantor on behalf of all authors (“Corresponding Author”). All authors collectively are referred to as the “Contributors”

In consideration of the BMJ Group (“the Publishers”) considering to publish the article contained within the original manuscript which includes without limitation any diagrams, photographs, other illustrative material, video, film or any other material howsoever submitted by the Contributor(s) at any time and related to the Contribution (“the Contribution”) in the BMJ (“the Journal”), certain rights are required to be granted by each different category of author(s), which are as follows:

1. For employees of the **UK Crown acting in the course of their employment**- a non exclusive Licence, as set out below. All provisions of this document apply. The non exclusivity relates to the original submitted manuscript video, films, images, photographs, diagrams and/or illustrative material only.
2. For employees of the **US Federal Government employees acting in the course of their employment**, no copyright exists and the Contribution is in the public domain so no licence is required to be granted. The Author Warranties below apply (excluding 1.iii).
3. For all other authors, an exclusive Licence, as set out below. All provisions of this document apply.

**NB** where a Contribution is a multi authored work, each author’s element of the Contribution will be dealt with in accordance with 1, 2 or 3 above, as applicable.

#### **The Licence**

The Licence granted in accordance with 1 or 3 above is:

A worldwide, licence, to the Publishers and its licensees in perpetuity (subject to the Reversion of Rights set out below), in all forms, formats and media (whether known now or created in the future), **to** i) publish, reproduce, distribute, display and store the Contribution, ii) translate the Contribution into other languages, create adaptations, reprints, include within collections and create summaries, extracts and/or, abstracts of the Contribution and convert or allow conversion into any format including without limitation audio, iii) create any other derivative work(s) based in whole or part on the Contribution, iv) to exploit all subsidiary rights that currently exist or as may exist in the future in the Contribution, v) the inclusion of electronic links from the Contribution to third party material where-ever it may be located; and, vi) licence any third party to do any or all of the above.

If you and/or any co-author’s employer owns the copyright to your contribution you must obtain in writing the relevant employers’ consent to grant the licence and agree to all obligations herein. The author(s) hereby agree that in the event that the BMJ Group sell, the whole or part of its journal business to any third party, the benefit and the burden of the Licence contained herein shall be assigned to that third party.

#### **Additional Rights and Obligations**

The author(s) (and their employers as applicable), hereby authorise the Publishers to take such steps as they consider necessary at their own expense in the copyright owners name and on their behalf, if they believe that a third party is infringing or is likely to infringe copyright or the rights granted to the Publishers herein in the Contribution without further recourse to the copyright owner(s).

For Original Research articles and Open Access Funded Articles (as both defined below), the Publishers expressly agree to place the published Contribution for display on PubMed Central (including its international mirror sites) promptly without charge to the authors or their employers (provided Pubmed Central does not charge the Publishers), which will include any Publishers’ supplied amendments or retractions.

“**Original Research**” means an article reporting a research study, with a research structured abstract and normally appearing in the Research section of the BMJ. “**Open Access Funded Articles**” means articles funded in whole or part by a research grant from a government and/or charitable organisation(s) that requires open access deposit in PubMed Central. Such articles are identified by the reference to a Creative Commons licence.

The author(s) acknowledge and accept that BMJ Group may make additional changes to the contribution as considered necessary in accordance with standard editorial processes whether before or after publication. The Corresponding Author will usually see proofs for their Contributions and every effort will be made to consult with the Corresponding Author if substantial alterations are made. The BMJ Group may also retract or publish a correction or other notice when it considers this appropriate for legal or editorial reasons and this shall be at its absolute discretion which shall be exercised reasonably.

#### **Reversion of Rights**

If the Contribution is not published in either the print or electronic versions of the Journal or any other Publisher(s) products, within 12 months of final acceptance by the BMJ Group, (or as otherwise agreed), any Licence granted herein shall automatically terminate and all rights shall revert to the copyright owner. The Publishers may keep a copy of the Contribution as a record (including via any contractor).

#### **Rights Granted to Owners of the Contribution**

Ownership of copyright remains with the author(s) or their employers. All rights not expressly granted are, subject to the Licence terms, reserved by the Publishers. In return for the grant of the Licence herein, the copyright owner(s) shall have the following rights for **non-Commercial Use (unless otherwise stated)** of the Contribution:

1. The right to reproduce a reasonable number (no more than 100) print copies of the final Contribution, by copying or downloading from the BMJ Group website, for personal use and to send copies to colleagues in print or electronic form provided no fee is charged and this is not done on a systematic basis (which includes via mass e-mailings).

2. The right to include the Contribution in a compilation for classroom use (course packs) to be distributed free of charge (other than for direct photocopying cost) to students at the Contributor(s)'s institution or to be stored in digital format in data rooms for access by students as part of their course work and for in house training programmes of the Contributor(s)'s employer or at seminars or conferences subject to a limit of 100 copies per conference or seminar.

3. For all articles (excluding articles commissioned by the Publishers), the right to post a version of the final published version of the Contribution, or any abstract of the final published Contribution on the Contributor(s)'s own and/or his/her institution's website after the Publisher's publication.

4. For all Publisher commissioned articles, the right to post a version of the final published version of the Contribution, or any abstract of the final published Contribution on the Contributor(s)'s own and/or his/her institution's website 12 months after publication.

5. The following statement must accompany the articles posted on the Contributor(s)'s and/or his/her institution's website:

“This article has been published in the BMJ [insert full citation reference] and can also be viewed on the journal's website at [www.bmj.com](http://www.bmj.com)“

6. In addition, for Original Research articles and Open Access Funded Articles copyright owners (and the Publishers) may and may allow third parties to use the Contribution in accordance one of the following Creative Commons licences depending on the source of the research funding as per below:

a) where the Original Research article and/or Open Access Funded Articles **is not** funded by the Wellcome Trust or UK Research Council, the articles may be re-used under the terms of the Creative Commons Attribution-Non Commercial 3.0 Unported (CC BY-NC 3.0) see:

<http://creativecommons.org/licenses/by-nc/3.0/>

1  
2  
3 and

4 <http://creativecommons.org/licenses/by-nc/3.0/legalcode>

5 or any updated versions as determined by the Publisher from time to time.

6  
7 or

8 b) where the Original Research article and/or Open Access Funded Articles is funded by the Wellcome  
9 Trust or UK Research Council, the Contribution may be re-used under the terms of the Creative  
10 Commons Attribution 3.0 Unported Licence (CC BY 3.0) see:

11 <http://creativecommons.org/licenses/by/3.0/>

12 and

13 <http://creativecommons.org/licenses/by/3.0/legalcode>

14 or any updated versions as determined by the Publisher from time to time

15  
16  
17  
18 subject to ensuring the Publishers and the Journal are referenced (including a full citation) as set out  
19 above; all third party rights within all images, diagrams, photograph, other illustrative material or  
20 films, not owned by the authors or BMJ Group are cleared independently and appropriately; and all the  
21 Publishers trademarks are removed from any derivative works and ensuring any translations, for which  
22 a prior translation agreement with BMJ Group has not been established, must prominently display the  
23 statement: "This is an unofficial translation of an article that appeared in a BMJ Group publication.  
24 BMJ Group has not endorsed this translation".

25  
26 7. The right to publish with the necessary acknowledgement of the Publishers and the Journal, all or  
27 part of the material from the published Contribution in a book, essay, position paper, or other non peer  
28 reviewed publication authored or edited by the Contributor(s)'s (which may be a Commercial Use).  
29 This does not apply to multiple Contributions in the same journal, for which permission from the  
30 Publishers must be sought.

31 8. The right to use selected figures and tables and (of which the author or his employer owns or has  
32 licensed) and selected text (up to 300 words) from the Contribution for incorporation within another  
33 work published in print or digital format by a third party, so long as full credit is given to the Publishers  
34 and use of the parts of the Contribution is non Commercial Use.

35 9. Subject to it not being contrary to English law to do so (such as for example where the UK has  
36 trading or other bans with the country of the Corresponding Authors origin or certain groups of people  
37 within), the right to receive a royalty for up to 5 years from publication of 10% of any net receipts less  
38 sales commission on single orders in excess of £2000 received by the Publisher for any single  
39 Contribution reprint or translation sales to a single third party, subject however to any fee being  
40 determined (if charged) at the absolute discretion of the Publishers as may be altered from time to time.  
41 If the Publishers receive such an order for reprint sales of the Contribution, they will contact the  
42 Corresponding Author at the address given on the published Contribution to find out to whom payment  
43 should be made. Corresponding Authors have the responsibility to ensure that all authors have agreed  
44 what should be done with any such royalty payment and to keep the Publisher updated with current  
45 contact details.

46 For permission to use materials that are beyond permitted here, visit [http://www.bmj.com/about-](http://www.bmj.com/about-bmj/resources-readers/permissions)  
47 [bmj/resources-readers/permissions](http://www.bmj.com/about-bmj/resources-readers/permissions)

48  
49 "Commercial Use" includes:

- 50 - copying or downloading of documents, or linking to such postings, for further  
51 redistribution, sale or licensing, for a fee;
- 52 - copying, downloading or posting by a site or service that incorporates advertising  
53 with such content;
- 54 - the inclusion or incorporation of document content in other works or services (other  
55 than for legally permitted quotations with an appropriate citation) that is then  
56 available for sale or licensing, for a fee.
- 57 - use of documents or document content (other than for legally permitted quotations  
58 with appropriate citations) by organisations for any promotional or advertising  
59  
60

purposes whether direct or indirect, whether for a fee or otherwise. Distribution by or on behalf of pharmaceutical organisations is considered in all cases as Commercial Use;

- use for the purposes of monetary reward by means of sale, resale, license, loan, hire transfer or other form of commercial exploitation.

#### **Author warranties**

1. The author(s) warrant that: i) they are the sole author(s) of the Contribution which is an original work; ii) the whole or a substantial part of the Contribution has not previously been published; iii) they or their employers are the copyright owners of the Contribution; iv) to the best of their knowledge that the Contribution does not contain anything which is libellous, illegal or infringes any third party's copyright or other rights; v) that they have obtained all necessary written consents for any patient information which is supplied with the Contribution and vi) that they have declared or will accurately declare all competing interests to the Publisher.

#### **Anti Bribery**

As a service provider to the BMJ Group, you agree that you shall: (a) comply with all applicable laws, statutes, regulations and codes relating to anti-bribery and anti-corruption including but not limited to the Bribery Act 2010 (Relevant Requirements); b) not engage in any activity, practice or conduct which would constitute an offence under sections 1, 2 or 6 of the Bribery Act 2010 (as amended) if such activity, practice or conduct had been carried out in the UK; (c) comply with any Publisher Ethics and Anti-bribery Policy supplied to you from time to time including as contained as follows (Relevant Policies):

<http://group.bmj.com/group/about/corporate/Anti-Bribery%20and%20Corruption%20Policy%20August%202012.pdf>;

(d) promptly report to the Chief Executive Officer or Chairman of the Publisher any request or demand for any undue financial or other advantage of any kind received by you in connection with the performance of this Agreement; Breach of this Clause shall be deemed a material breach of this Agreement.

#### **Law and Jurisdiction**

To the fullest extent permitted by law, this Agreement will be governed by the laws of England and shall be governed and construed in accordance with the laws of England whose courts shall have exclusive jurisdiction, unless as at the date of formation of this Agreement either i) an English judgement could not be enforced in the Corresponding Author's stated country location; or ii) it would take six months or more for the BMJ Group to enforce an English judgement in the Corresponding Author's stated country location, then it is hereby agreed that this Agreement shall be governed by the laws of the Corresponding Author's stated country (or state if applicable) and their courts shall have jurisdiction. Notwithstanding any of the above, this clause is governed by the laws of England.

#### **The following statement must be included in your manuscript, together with the relevant tick box line below:**

"I, Amélie Yavchitz, The Corresponding Author of this article contained within the original manuscript which includes any diagrams & photographs within and any related or stand alone film submitted (the Contribution") has the right to grant on behalf

of all authors and does grant on behalf of all authors, a licence to the BMJ Publishing Group Ltd and its licencees, to permit this Contribution (if accepted) to be published in the BMJ and any other BMJ Group products and to exploit all subsidiary rights, as set out in our licence set out at:

[http://www.bmj.com/about-bmj/resources-authors/forms-policies-and-checklists/copyright-open-access-and-permission-reuse.](http://www.bmj.com/about-bmj/resources-authors/forms-policies-and-checklists/copyright-open-access-and-permission-reuse)"

*IF YOU ARE A NATIONAL INSTITUTE OF HEALTH ("NIH") EMPLOYEE, CONTRACTOR OR TRAINEE* the following cover sheet will be accepted by the BMJ Group and NIH and incorporated into the above Licence.

Please tick **one or more** boxes as appropriate:

- I am the sole author of the Contribution.
- I am one author signing on behalf of all co-owners of the Contribution.
- The Contribution has been made in the course of my employment and I am signing as authorised by my employer.
