## KEY MESSAGES

- The development of safe and effective covid-19 vaccines is one of the great success stories of the covid-19 pandemic.
- It is essential that decisions about implementing vaccination programmes in the UK are robust, clear and open to public and professional scrutiny.
- A sustainable infrastructure for vaccine delivery is needed that integrates with general practices and pharmacies.
- The UK needs to ensure it has the academic and industrial infrastructure to develop and test vaccines for the current and any future pandemic.

## Contributors and sources

**Azeem Majeed** is a professor of primary care and public health whose general practice is a member of a GP Federation delivering covid-19 vaccines. He has published on areas such as the logistical issues in vaccination programmes and addressing vaccine hesitancy. He works with local and national organisations to improve vaccine uptake.

**Katrina Pollock** is senior clinical research fellow in vaccinology and honorary consultant physician at Imperial College London. She is chief and principal investigator for clinical trials of novel vaccines including the Imperial College London self-amplifying RNA covid-19 vaccine candidate and the Oxford Astra Zeneca covid-19 vaccine, as well as for experimental medicine studies of prototype immunogens and human immunology studies of vaccine responses. She is leading the Imperial College London vaccine research response to covid-19

1  
2  
3 36 **Simon Hodes** is an NHS GP trainer, appraiser, PCN lead and LMC member based in  
4 37 Watford. He has various opinion pieces and educational modules published on GP topics  
5 38 including continuity of care, advanced care planning and the covid-19 vaccination  
6 39 programme. His practice was a first wave vaccine site.  
7 40

8 41 **Marisa Papaluca** is a Visiting Professor at Imperial College London. She is former Senior  
9 42 Scientific Advisor at the European Medicines Agency where she worked for over 25 years  
10 43 with a focus on scientific, technical and therapeutic innovation in pharmaceuticals. She  
11 44 published in areas such as biotechnology and nanotechnology based medicinal products,  
12 45 gene therapy, cell therapy, pharmacogenetics, biomarkers, clinical trials methodology.

#### 14 46 15 47 **Acknowledgements**

16 48 We thank patient collaborators from the NIHR Applied Research Collaboration NW London  
17 49 and the Imperial Vaccines Research Centre for their comments on the article. Imperial  
18 50 College London is grateful for support from the National Institute for Health (NIHR) Research  
19 51 Applied Research Collaboration (ARC) Northwest London. The views expressed in this  
20 52 publication are those of the authors and not necessarily those of the NIHR or the  
21 53 Department of Health and Social Care.  
22 54

#### 23 55 **Patient involvement**

24 56 We received feedback on the on the article from public and patient groups linked to the  
25 57 NIHR Applied Research Collaboration NW London and the Imperial Vaccines Research  
26 58 Centre. The feedback emphasised the importance of clear, positive messages about  
27 59 vaccination for the public; and personalised support for people who were vaccine hesitant or  
28 60 who had concerns about vaccination to help increase vaccine uptake.  
29 61

#### 30 62 **Conflicts of Interest**

31 63 We have read and understood [BMJ policy on declaration of interests](#) and have the following  
32 64 interests to declare: No competing interests.

## Covid-19 vaccination in the United Kingdom

### Standfirst

*Azeem Majeed and colleagues argue that it is essential that decisions about approving covid-19 vaccines and strategies for their use in the UK are rapid and transparent; and that a sustainable infrastructure is put in place for delivering covid-19 vaccines to the public. This requires data supporting government decisions to be readily accessible and sufficiently detailed to address any questions from the public and professionals. It is also essential that the UK has the capacity to develop, test and manufacture vaccines for the current and any future pandemic at the speed and quantity needed.*

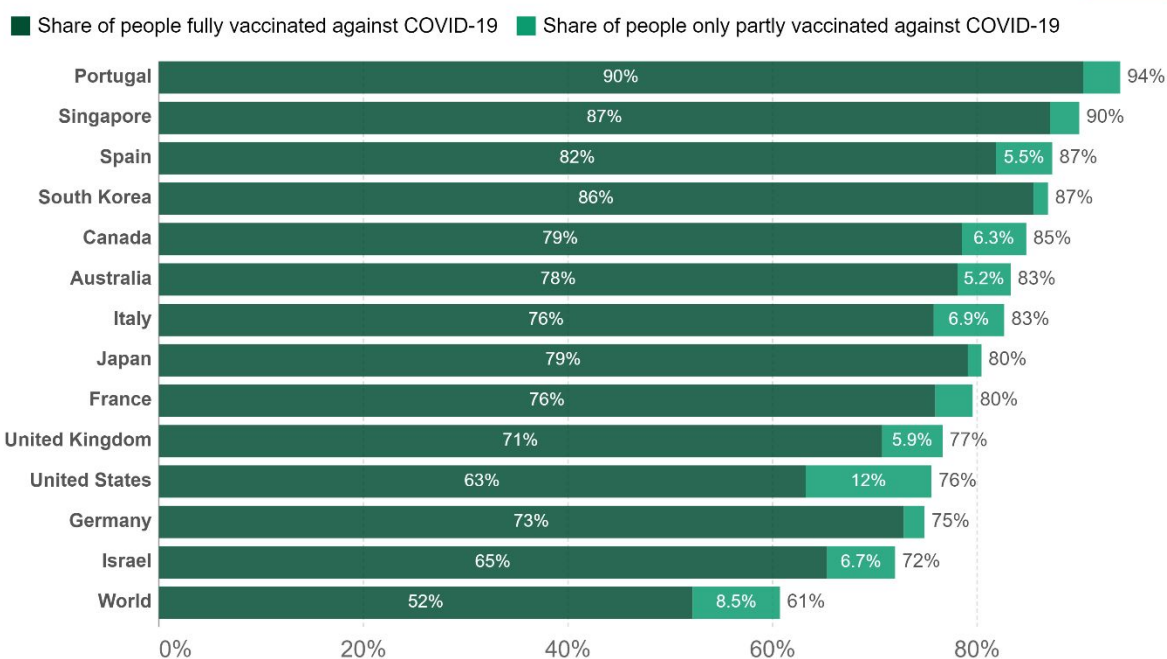

Within one year of the genome of the SARS-CoV-2 being sequenced, vaccines had been developed; tested in randomised controlled trials; and rolled out in population-based vaccination programmes across the world. This is one of the great success stories of the covid-19 pandemic. Vaccination offers countries a method of suppressing the number of people with a serious illness that could lead to hospitalisation or death; thereby allowing societies to return to a more normal way of living and working.[1]

The vaccination programme in the United Kingdom (UK) has been heralded by the government as “world-beating” on many occasions.[2] But is this the case? Does the UK remain a world-leader in vaccination; and what can be learned from the approval of vaccines in the UK and the implementation of vaccination programmes by the NHS? We discuss these issues in this article. In terms of implementation, we focus mainly on England because health in the UK is a devolved responsibility, and there were some minor differences in implementation of vaccination programmes between the four UK countries.[3]

Although the covid-19 vaccination programme in the United Kingdom did start well, and more quickly than in other countries, it began to slow down during the summer of 2021 before speeding up again towards the end of 2021, and then slowing down again in early 2022. The UK has now been overtaken by many other countries in the proportion of the population vaccinated with two doses (Figure 1); although the UK does remain ahead of most countries in the proportion of adults who have three vaccinations. The UK was also slower to approve vaccines for use in children than some other countries and by early 2022 was yet to approve vaccination for all 5-11 year old children.

119 **Development and testing of covid-19 vaccines**

120 With the onset of the covid-19 pandemic, a race began to develop and test covid-19  
 121 vaccines. The first vaccines developed fell into two broad groups: mRNA vaccines and viral  
 122 vector vaccines. Early results from randomised controlled trials of these vaccines showed  
 123 excellent efficacy against covid-19, and remarkable protection against serious illness and  
 124 death.[4, 5] There were also no major safety concerns from these studies. Subsequent  
 125 evaluations using real-world data on much larger populations than in the clinical trials  
 126 confirmed the general safety and effectiveness of these vaccines in adults.[6, 7] One  
 127 limitation of current vaccines is that although they are very successful in reducing the  
 128 number of serious cases of covid-19, they are less effective in preventing infection from  
 129 SARS-CoV-2; which means that vaccinated people can still become infected and infect  
 130 others - but at a lower level than in people who are unvaccinated. Early on in the vaccination  
 131 programme, this was not always communicated well to the public; leading to unrealistic  
 132 expectations about how well vaccines would work in suppressing the risk of infection.

133

### 134 **Approval of vaccines in the UK**

135 Responsibly for licensing vaccines for use in the UK lies with the Medicines and Healthcare  
136 products Regulatory Agency (MHRA). The MHRA developed dedicated work programmes to  
137 secure the necessary scientific resources to support vaccine developers; and to establish a  
138 dialogue on areas such as manufacturing, efficacy and toxicology. They also initiated a new  
139 process called “rolling reviews”, which has allowed pharmaceutical companies to submit  
140 data to regulators in an ongoing fashion, thus allowing regulators to gain knowledge on the  
141 findings emerging from clinical studies. In UK, there are also legal provisions for emergency  
142 use authorisation in exceptional circumstances, such as population-wide vaccination  
143 campaigns during pandemics.[8]

144  
145 The UK became the first country in Europe to grant an Emergency Use Authorisation for a  
146 covid-19 vaccine when the MHRA gave approval for use of the Pfizer-BioNTech vaccine in  
147 adults in the UK on 2 December 2020. The AstraZeneca vaccine was approved for use in  
148 adults on 30 December 2020. After MHRA-approval, the Joint Committee on Vaccination  
149 and Immunisation (JCVI) then makes recommendations on the use of vaccines by the NHS  
150 and prioritisation of different groups for vaccination. The final decision about the  
151 implementation of vaccine programmes lies with the government.

152  
153 Given the limited supply of vaccines available to the UK in the early part of programme, the  
154 JCVI produced a priority list for vaccination – largely based on age as modelling data  
155 showed that the greatest population benefits from vaccination would come from targeting the  
156 elderly. High priority for vaccination was also given to health and care workers, and the  
157 residents and staff of care homes.[Box 1] The rationale for this strategy was to vaccinate the  
158 groups most at risk from serious illness and death first, along with those at greatest  
159 occupational risk of exposure to infection, before moving on to other groups. Overall, the  
160 policy was fair but there were criticisms that the prioritisation did not target ethnic minority  
161 groups or occupational groups other than health and care workers at higher risk from covid-  
162 19, such as people working in public transport or teaching.[9]

**Box 1. JCVI advice on priority groups for covid-19 vaccination, 30 December 2020**

1. residents in a care home for older adults and their carers
2. all those 80 years of age and over and frontline health and social care workers
3. all those 75 years of age and over
4. all those 70 years of age and over and clinically extremely vulnerable individuals
5. all those 65 years of age and over
6. all individuals aged 16 years<sup>[footnote 2]</sup> to 64 years with underlying health conditions which put them at higher risk of serious disease and mortality
7. all those 60 years of age and over
8. all those 55 years of age and over
9. all those 50 years of age and over

Shortly after the start of the vaccination programme in the UK, the government took the decision to prioritise delivery of the first dose of covid-19 vaccine over the second dose. Practically, this meant a delay in giving the second dose of vaccine from 3-4 weeks after the first dose to up to 12 weeks. The rationale for this was that prioritising first doses would allow more people to receive one dose of vaccine and thereby gain protection against covid-19. In theory, this would boost protection from SARS-CoV-2 at a population level, albeit at the cost of a short-term reduction in overall protection for individuals whose second dose was delayed. There was also disruption to the immunisation programme that was already underway, with many people having their appointments for their second doses cancelled.

Covid-19 case numbers were also high in the UK for large periods during 2021. This could drive transmission of infection in a partially vaccinated population, leading to the risk of developing SARS-CoV-2 vaccine escape variants. Seen by some as radical, and a departure from the clinical trials evidence, particularly for the mRNA vaccines, this delayed booster approach was not widely adopted by other countries. Subsequent research did however suggest that there were some benefits for individuals in delaying the second vaccine dose; but this did not translate into any major benefits at a population level.

**Approval of vaccines for adolescents and children**

Although the UK was an early adopter covid-19 vaccines for use in adults, it was slower than many other countries in implementing vaccination in 16-17 year olds and then in 12-15 year olds. Other countries were also quicker to start vaccination in children aged 5-11 years. The delay in authorising vaccination for 12-15 year olds resulted in programmes not beginning until after the start of the 2021-22 school year (August 2021 in Scotland, September 2021

1  
2  
3 207 elsewhere in the UK). The programme was then beset by delays (particularly in England),  
4 208 resulting in slow progress with vaccination at a time when many schools faced large covid-  
5 209 19 outbreaks. The policy in the UK was to initially offer one dose to younger people to limit  
6 210 the risks from myocarditis. However, a one-dose policy would reduce the benefits of  
7 211 vaccination, particularly against the delta variant of SARS-CoV-2 that became the  
8 212 predominant strain in the UK in summer 2021 and against the Omicron variant later in the  
9 213 year.[10] In December 2021, a two-dose approach was finally agreed for 12-15 year old  
10 214 children. Booster doses were also later approved for 16-17 year olds.  
11 215

12 216 The JCVI did face considerable criticism for its delay in recommending vaccination for  
13 217 children and adolescents. However, early on, there was a lack of data supporting the  
14 218 unequivocal benefits versus the risks for the use of covid-19 vaccines in children. The  
15 219 vaccines were initially tested in trials designed to analyse safety and efficacy in the  
16 220 prevention of covid-19 in adults. Severe disease is considerably rarer in children (even  
17 221 though infection with SARS-CoV-2 is common) than in the elderly.[11] The risk/benefit  
18 222 analysis is therefore finely balanced, particularly in boys aged 16-19 years where there is a  
19 223 risk of myocarditis after vaccination. As vaccination in children becomes more widespread  
20 224 globally, new data is continually emerging about the risks and benefits of vaccination in this  
21 225 group, which should confirm its safety.  
22 226

### 227 **Third primary doses and booster doses**

228 Additional problems arose after the decision to give some immunocompromised people a  
229 third primary dose of vaccine.[12] The rationale for this was these people often had a poor  
230 response to two doses of vaccine and that a third dose would prime their immune system  
231 better and offer improved protection from serious illness. The programme was rolled out with  
232 little central or local planning, resulting in considerable confusion amongst both the public  
233 and NHS staff; and leading to delays in many eligible people getting their third primary  
234 vaccine dose.[13] A key lesson from this component of the vaccination programme was the  
235 need to give the NHS adequate time to plan; and to ensure that NHS staff are fully briefed in  
236 advance of any public announcement or media briefing about vaccination policy.  
237

238 Around the same time, the NHS also began to offer selected groups of people a booster  
239 vaccine dose. Real-world evaluations of vaccine efficacy suggested that protection from  
240 vaccines begins to decline after a few months from the second dose; and that a booster  
241 dose offered increased protection from serious illness and death. This is particularly the case  
242 for the Omicron variant of SARS-CoV-2. The decline in the efficacy of vaccines is greater for  
243 the AstraZeneca vaccine; casting doubt on the longer-term use of this vaccine in the UK

1  
2  
3 244 despite its lower cost and easier storage requirements than mRNA vaccines. Currently, we  
4 245 do not know how long the additional protection from a booster dose will last; and whether  
5 246 additional booster doses will be required in the future, possibly with modified vaccines to  
6 247 target new variants, thereby making covid-19 vaccination more like influenza vaccination.  
7  
8  
9  
10 248

### 11 249 **IT Systems**

12 250 In England, a decision was made at the start of the vaccination programme to record data  
13 251 using separate IT systems (Box 2) rather than directly into a patient's medical record.[3] One  
14 252 of the main reasons for this decision was that not all vaccination sites would have access to  
15 253 the electronic medical record systems used by NHS primary care teams. After vaccination,  
16 254 data was then transferred to the patient's general practice to ensure a record of the  
17 255 vaccination appeared in their electronic primary medical care record. This process  
18 256 sometimes failed, resulting in missing vaccination data for some patients. There were also  
19 257 issues with recording third primary vaccines and vaccines for people who had been  
20 258 vaccinated in another UK country or overseas because of delays in updating IT systems.  
21  
22

#### 28 260 **Box 2. IT system for Covid-19 vaccination in England**

29 261 **National Booking Service:** Use by the public to book vaccination appointments

30 262 **NHS Foundry:** Data collection, processing and visualisation platform

31 263 **National Immunisation Management System:** Records vaccination details and adverse  
32 264 reactions

33 265 **Outcomes4Health (Pinnacle):** Used by community vaccinations sites to record details of  
34 266 vaccinations

35 267 **National Immunisation and Vaccination System:** Used to record vaccinations in hospital  
36 268 sites

37 269 **GP Electronic Patient Record Systems:** Not directly used in the vaccination programme.  
38 270 Vaccination records from other systems are sent electronically to these systems.  
39  
40  
41  
42  
43  
44  
45  
46 271

47 272 Other problems arose in the transfer of vaccination data to the NHS app in England. With  
48 273 proof of full vaccination now often being required for international travel (sometimes referred  
49 274 to as "vaccine passports"), it is essential for vaccination data to show in the NHS app.  
50 275 Because vaccine sites did not usually have full access to patients' medical records, they  
51 276 were not able to deal with these queries. General practices were therefore faced dealing with  
52 277 large numbers of questions from patients about data and vaccine passport issues; and also  
53 278 about eligibility for additional vaccinations in immunocompromised people. A key lesson for  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 279 the future is to have well-functioning IT systems and also clear processes for recording  
4 280 vaccines in people who were vaccinated outside the UK's official programme.

5  
6 281

### 7 8 282 **Addressing vaccine hesitancy**

9 283 Concerns about Covid-19 vaccination and the resulting vaccine hesitancy are important  
10 284 issues globally.[14] Early survey data showed that the UK had lower overall levels of vaccine  
11 285 hesitancy than many other countries; however, people in the youngest age groups and those  
12 286 from ethnic minority groups were more likely to report they would decline covid-19  
13 287 vaccination. Once vaccination started in the UK, vaccination rates were lowest in these  
14 288 groups, leaving around 8% of people aged 12 and over currently unvaccinated across the  
15 289 UK; with vaccination rates lowest in large urban areas such as London. One key lesson for  
16 290 the future is therefore to have clear plans in place to improve confidence in vaccines and  
17 291 improve vaccine uptake; particularly among younger people, those from ethnic minority  
18 292 groups, and people living in deprived areas. Local community engagement is essential for  
19 293 this and there are numerous examples from around the UK of local initiatives that helped to  
20 294 improve vaccine uptake.

21  
22 295

### 23 296 **Infrastructure for vaccine delivery**

24 297 The NHS has used a range of sites to deliver vaccines. These included sites run by hospitals  
25 298 as well as GP-led and community pharmacy sites. In the first phase of the vaccination  
26 299 programme (for people aged 18 and over), the majority of vaccines were delivered by GP-  
27 300 led sites. In the longer term, the NHS needs to decide how covid-19 vaccines will be  
28 301 delivered. A GP-led programme for delivery – supported by pharmacies and hospital sites –  
29 302 offers many potential benefits. This includes the easier access to GP and pharmacy sites for  
30 303 patients than hospitals; and on the ongoing relationships that primary care teams have with  
31 304 their patients that can help improve vaccination rates in people who are vaccine hesitant or  
32 305 who are not concerned by the possible impacts of covid-19 on their health. The greater  
33 306 frequency of contact between NHS primary care staff and patients also offers opportunities  
34 307 to increase uptake through raising vaccination during other clinical encounters, as well as  
35 308 providing the opportunity for health promotion activities, including co-administration of other  
36 309 vaccines such as for influenza during vaccination appointments.

37  
38 310

### 39 311 **Monitoring vaccine uptake, safety and efficacy**

40 312 One area in which the UK excelled internationally was in using data from the NHS, covid-19  
41 313 testing, and national mortality records to monitor vaccine uptake, safety and effectiveness.  
42 314 Using data from the four UK nations, Public Health England established a dashboard that  
43 315 allowed daily vaccine delivery data to be viewed (this work later transferred to the Health

1  
2  
3 316 Security Agency).[15] Other outputs included weekly vaccination publications with more  
4 317 detailed data on vaccine uptake by age group. Some vaccine efficacy data was also  
5  
6 318 included in these publications.[16]  
7

8 319  
9 320 Additional data on vaccine safety and efficacy came from information from electronic GP  
10 321 records linked to other data, and the yellow card scheme that allows reports of side effects  
11 322 from both professionals and patients.[8] This allowed research on the effectiveness of  
12 323 vaccines; for example, in preventing hospitalisations and deaths; as well as research on the  
13 324 side-effects of vaccination. Because randomised controlled are generally too small to identify  
14 325 rare but serious side effects, large clinical databases are needed to provide these data. In  
15 326 the UK, this includes databases such as OpenSAFELY and QResearch (58 million and 12  
16 327 million patients respectively). [17, 18] Real-world data has also informed vaccination policy in  
17 328 groups for whom data was lacking in clinical trials – for example, in pregnant women and in  
18 329 young people.  
19  
20  
21  
22  
23  
24

25 330  
26 331 In the longer term, the large clinical databases established in the UK will provide information  
27 332 for public health planning globally. This would include, for example, information on how  
28 333 quickly vaccine efficacy weakens in different groups of people and the effectiveness of  
29 334 booster doses; which will guide policies on the necessity and frequency of additional  
30 335 vaccinations. The databases will also allow the detection of rare but serious side effects from  
31 336 vaccination. It will also be possible to compare the safety and efficacy of different vaccines;  
32 337 and the effectiveness of vaccines against any new variants of SARS-CoV-2 that emerge.[8]  
33  
34  
35  
36  
37  
38

### 39 **Ensuring vaccine supply for the UK**

40 340 Early on in its vaccination programme, the UK government found itself in a dispute with the  
41 341 European Commission, related to the failure of AstraZeneca to supply the contracted  
42 342 volumes of its vaccines to member states of the European Union.[19] The European  
43 343 Commission then threatened to reduce exports of Pfizer vaccines to the UK. In the final  
44 344 event, no restrictions were imposed and the UK continued to received its due amounts of  
45 345 Pfizer vaccines. The episode does illustrate, however, that the UK is currently very reliant on  
46 346 overseas-manufactured vaccines (principally, Pfizer vaccines from the European Union).  
47 347 With the USA also prioritising its own citizens for vaccines, the UK government will need to  
48 348 consider how it works with the pharmaceutical industry, biotechnology companies and  
49 349 universities to ensure that the UK can develop, test and manufacture vaccines for the current  
50 350 and any future pandemic at the speed and quantity needed.  
51

## 352 **Lessons for the future**

353 Overall, there were many successes in the UK's Covid-19 vaccination programme - such as  
354 the excellent data on vaccine uptake and effectiveness - but also issues that need to be  
355 addressed. One key lesson for the future is that investment in the UK's scientific  
356 infrastructure is essential so that the UK is prepared for any future pandemic. Sharing of  
357 scientific information and data between countries is also needed.[20] It is also essential to  
358 have rapid systems for approving vaccines for use in the UK, and data for monitoring safety  
359 and effectiveness, which are needed for the detection of rare but potentially serious side  
360 effects and generating data on the risk-benefit equation on the use of vaccines in groups  
361 such as children and pregnant women. Good IT systems are also essential for identifying  
362 patients in priority groups for vaccination; and for establishing vaccine booking and recording  
363 systems that are easy for the public to use and which seamlessly transfer data to primary  
364 care medical records and the NHS App.

365

366 A sustainable infrastructure for vaccine delivery is also needed that allows high uptake of  
367 vaccines to be achieved rapidly in all population groups, including those that are vaccine  
368 hesitant or who are less concerned about the risks of infection. Finally, an effective public  
369 and professional dialogue is needed on all decisions about the approval of vaccines so that  
370 there is full confidence in decisions taken by bodies such as the JCVI, particularly where the  
371 UK veers away from the international consensus; for example, in the use of vaccines in  
372 children and adolescents, and in modifying dosing schedules. This might require, for  
373 example, the JCVI holding meetings in public and having much more rigorous press  
374 conferences after its meetings; and also responding to written questions from the public and  
375 from professional organisations about its recommendations.
