

Tabel 1

From Table 2 BMJ 2015;351h4901 “comparing 5-yr relative with 5-yr overall survival of the 2006-2012 cohort” deduced:

“Approximate breast cancer-related mortality”		“ mortality in matched population”*
< 50 yr	5%	1%
50-75yr	3%	4%
>75yr	9%	39%

**relative survival = observed survival divided by expected survival of corresponding general population matched by sex, age and year of diagnosis*
